Notice to Manualholders

PERSONAL LINES
DWELLING POLICY PROGRAM MANUAL – MULTISTATE RULES
NOTICE DP-MU-2014-RU-001

CAUTION

Refer to state Notices for announcement of the use of this revision in individual jurisdictions.

INSTRUCTIONS TO MANUALHOLDERS

If your company has adopted this revision, you should insert the enclosed page(s) into your manual.

EFFECTIVE DATE

Refer to individual state Notices for effective date language.

CHANGE(S)

This notice presents the 2014 revisions to the Dwelling Policy Program Manual – General Rules. The following rules were revised:

- Rule **102.** Perils Insured Against has been revised to more closely reflect coverages provided by the individual Dwelling Policy forms.
- Rule **104.** Protection Classification Information has been revised to refer manual users to the ISO Community Mitigation Classification (CMC) Manual when determining the ISO Public Protection Classification information.
- Rule **210.** Refer To Company has been revised to introduce a facultative reinsurance rule.
- Rule **402.** Coverage **C** – Personal Property In Buildings Subject To Commercial Class Rates Or Specific Rates has been revised to complement changes made in Division Five of the Commercial Lines Manual (CLM).
- Rule **501.** Coverage **B** – Other Structures has been revised to add instructions which advise that no entry is needed in the policy Declarations for Coverage **B** since this coverage is automatically provided on a blanket basis for up to 10% of the Coverage **A** limit in all Dwelling policy forms.
- Rule **502.** Coverage **D** – Fair Rental Value and Coverage **E** – Additional Living Expense has been revised to add instructions which advise that no entry is needed in the policy Declarations for Coverage **D** in Form **DP 00 01** and for Coverages **D** and **E** in Forms **DP 00 02** and **DP 00 03** since these coverages are automatically provided for up to 20% of the Coverage **A** limit available. In addition, we have made changes to complement the companion forms filing.
- Rule **505.** Building Items Condo Unit-owner – **DP 00 01** Or **DP 00 02** has been revised to delete Paragraph **B.** to complement a change in the companion forms filing.
- Rule **510.** Theft Coverage has been revised to change the base deductible for Theft Coverage to $500 and introduce a new deductible factor for the $250 option. In addition, the factors for $1,000 and $2,500 have been revised to correspond with this change.
- Rule **513.** Limited Water Back-up And Sump Discharge Or Overflow Coverage has been revised to reflect that increased limits of coverage are now available.
- Rule **515.** Motorized Golf Cart – Physical Loss Coverage has been revised to delete text referencing the separate deductible for each involved golf cart.
- Rule **517.** Limited Fungi, Wet Or Dry Rot, Or Bacteria Coverage has been revised to reinforce that the limits provided are on an aggregate basis and to delete text to condense and streamline the rule.

© Insurance Services Office, Inc., 2014

Rule **211.** Additional Insured has been introduced to complement Additional Insured Described Location Endorsement **DP 04 41.**

Exceptions to the General Rules were previously filed and implemented on an individual state basis for eventual multistate application. Now that the exceptions apply in most states, the following exceptions are being relocated to the General Rules:

- Rule **303.** Ordinance Or Law Coverage – All Forms (Table **303.B.3.a.(1)(a)** and Table **303.B.3.a.(2)**)
- Rule **406.** Deductibles, multistate text in Paragraphs **A.** and **B.**
- Rule **503.** Ordinance Or Law Coverage For Coverage **B** – Specific Structures, Building Items And Improvements, Alterations And Additions (Paragraph **C.2.**)
- Rule **509.** Earthquake Coverage (Paragraphs **E.3., E.4., E.5.** and **F.**)

The following rules have been revised to make minor editorial revisions:

- Rule **204.** Multiple Locations
- Rule **205.** Multiple Policies
- Rule **304.** Permitted Incidental Occupancies
- Rule **404.** Mobile Or Trailer Homes – **DP 00 01** Only
- Rule **407.** Automatic Increase In Insurance
- Rule **408.** Protective Devices
- Rule **409.** Actual Cash Value Loss Settlement Windstorm Or Hail Losses To Roof Surfacing – **DP 00 02, DP 00 03** And **DP 00 01** With **DP 00 08**
- Rule **410.** Building Code Effectiveness Grading
- Rule **504.** Improvements, Alterations And Additions Tenant And Co-op Unit-owner – **DP 00 01** Or **DP 00 02**
- Rule **511.** Sinkhole Collapse Coverage

COMPANION REVISION

We are simultaneously revising our forms, which are being distributed under separate Notices.

REVISED PAGE(S)

DP-i thru DP-viii

DP-1 thru DP-23

PAGE CHECKLIST

Included in this distribution is a page checklist displaying the latest page numbers and edition dates.

REFERENCE INFORMATION (FOR COMPANY USE ONLY)

PART I
COVERAGE AND DEFINITION TYPE RULES

RULE 100.
INTRODUCTION

A. About The Dwelling Manual

The Dwelling Policy Program provides property and related coverages using the forms and endorsements referred to in this Manual. The rates, rules, forms and endorsements of the company shall apply in all cases not provided for in this Manual. This program does not apply to Farm Property. Refer to the company for its method of insuring farm property.

B. Manual Structure

1. Contents

The Dwelling Policy Program Manual contains the rules, classifications and rating provisions for the issuance of the Dwelling Policy. The Manual is divided into two sections, multistate general rules and state rules and rates.

The multistate general rules section contains rules common to most states. Any departures, additions, etc. to these rules, unique to individual jurisdictions, are contained in the state rules and rates section.

The general rules do **not** contain premiums, rates, charges or credits expressed in dollars and cents. They do, however, contain rating factors that are applied to state premiums.

2. General Rules

These rules are grouped into the following categories:

a. Part **I** – Coverage And Definition Type Rules,

b. Part **II** – Servicing Type Rules,

c. Part **III** – Base Premium Computation Rules,

d. Part **IV** – Adjusted Base Premium Computation Rules, and

e. Part **V** – Additional Coverages And Increased Limits Rules.

3. State Rules And Rates/ISO Loss Costs

These rules are grouped into the following categories:

a. Exceptions and Additional Rules,

b. Special State Requirements,

c. Territory Definitions,

d. Key Premium/Key Factor Tables, and

e. Premiums, Rates, Charges and Credits.

C. Company Rates/ISO Loss Costs

1. Definition

This Manual contains either ISO loss costs or individual company rates. A loss cost is that portion of the premium which covers only losses and the costs associated with settling losses.

2. Company Rates

All rules in this Manual are designed to be utilized with rates. All references in the rules and examples to rates and/or premiums (including base premiums) shall be interpreted to mean those established by the individual insurance company.

3. Loss Cost Conversion

Each insurance company must provide manualholders with either its own rates or with procedures to convert ISO loss costs to rates and/or premiums. If an insurer provides its own rates, use them in place of the ISO loss costs in this Manual. If an insurer does not provide its own rates, manualholders must convert ISO loss costs in this Manual to rates and/or premiums before applying any of the rules. Refer to the company for special instructions – including rounding procedures – on how to do this.

RULE 101.
FORMS, COVERAGES, MINIMUM LIMITS OF LIABILITY

A. Forms

The Dwelling Policy Program makes available the following policy forms:

1. Dwelling Property 1 Basic Form **DP 00 01,**

2. Dwelling Property 2 Broad Form **DP 00 02,** and

3. Dwelling Property 3 Special Form **DP 00 03.**

B. Coverages

1. Forms **DP 00 02** and **DP 00 03** provide the following coverages. These coverages are written as separate items in the policy or in separate policies:

a. Coverage **A** – Dwelling

b. Coverage **B** – Other Structures

c. Coverage **C** – Personal Property

d. Coverage **D** – Fair Rental Value

e. Coverage **E** – Additional Living Expense

2. Form **DP 00 01** provides Coverages **A** through **D;** Coverage **E** is available by endorsement.

© Insurance Services Office, Inc., 2003

RULE 101.
FORMS, COVERAGES, MINIMUM LIMITS OF LIABILITY
(Cont'd)

C. Minimum Limits Of Liability

The following coverages are subject to a minimum limit of liability:

Coverages	Minimum Limit
Coverage **A** – Dwelling	$12,000 (Form **DP 00 02**) $15,000 (Form **DP 00 03**)
Coverage **C** – Personal Property	$4,000 without Coverage **A** (Forms **DP 00 02** and **DP 00 03**)
There are **no** minimum limits for Form **DP 00 01**	

Table 101.C. Minimum Limits Of Liability

RULE 102.
PERILS INSURED AGAINST

The following is a general description of the coverages provided by the individual Dwelling Policy Forms. The policy should be consulted for exact contract conditions.

Perils	DP 00 01 Basic Form	DP 00 02 Broad Form	DP 00 03 Special Form
Fire or Lightning, Internal Explosion	Yes	Yes	Yes
Extended Coverage meaning Windstorm or Hail, Explosion, Riot or Civil Commotion, Aircraft, Vehicles, Smoke, Volcanic Eruption	Optional*	Yes	Yes
Vandalism or Malicious Mischief	Optional**	Yes	Yes
Damage by burglars, Falling objects, Weight of ice, snow or sleet, Accidental discharge or overflow of water or steam, Sudden and accidental tearing apart of a heating system or appliance for heating water, Freezing, Sudden and accidental damage from artificially generated electrical current.	No	Yes	Yes
Additional risks with certain exceptions	No	No	Yes***
* May only be written with the perils of Fire or Lightning, Internal Explosion ** May only be written with Extended Coverage *** Special Coverage (Coverages **A** and **B**)			

Table 102. Perils Insured Against

© Insurance Services Office, Inc., 2014

RULE 103. ELIGIBILITY

A Dwelling Policy may be issued to provide insurance under:

A. Coverage **A** – on a dwelling building:

1. Used solely for residential purposes except that certain incidental occupancies or up to 5 roomers or boarders are permitted;
2. Containing not more than four apartments; and
3. Which may be in a townhouse or rowhouse structure; or
4. In course of construction.

B. Coverage **A** – on a mobile or trailer home:

1. Using Form **DP 00 01** only;
2. Used solely for residential purposes except that certain incidental occupancies or up to 5 roomers or boarders are permitted;
3. Containing not more than one apartment;
4. For a policy period of not longer than one year; and
5. At the permanent location described in the policy.

C. Coverage **B:**

1. At the same location as the dwelling eligible for insurance under Coverage **A;**
2. Not used for business purposes except a permitted incidental occupancy or when rented for use as a private garage;
3. At a separate location when used in connection with the insured location but not for business purposes.

D. Coverage **C** in:

1. A dwelling, mobile or trailer home eligible under Coverage **A;** or
2. A dwelling with rental apartments including furnishings, equipment and appliances in halls or utility rooms; or
3. Any apartment, cooperative or condominium unit used as private living quarters of the insured or rented to others.

E. Coverage **D** for the loss of the fair rental value of:

1. A building eligible for insurance under Coverage **A** or **B;** or
2. Private living quarters eligible under Coverage **C.**

F. Coverage **E** for the additional living expenses incurred to maintain the insured's household.

RULE 104. PROTECTION CLASSIFICATION INFORMATION

Determine the ISO Public Protection Classification; refer to ISO's Community Mitigation Classifications (CMC) Manual, applicable to the municipality or classified area where the insured property is located.

RULE 105. SEASONAL DWELLING DEFINITION

A seasonal dwelling is a dwelling with continuous unoccupancy of three or more consecutive months during any one year period.

© Insurance Services Office, Inc., 2014

RULE 106.
CONSTRUCTION DEFINITIONS

A. Frame

Exterior wall of wood or other combustible construction, including wood iron-clad, stucco on wood or plaster on combustible supports or aluminum or plastic siding over frame.

B. Masonry Veneer

Exterior walls of combustible construction veneered with brick or stone.

C. Masonry

Exterior walls constructed of masonry materials such as adobe, brick, concrete, gypsum block, hollow concrete block, stone, tile or similar materials and floors and roof of combustible construction. (Disregarding floors resting directly on the ground).

D. Superior Construction

1. Non-Combustible

Exterior walls and floors and roof constructed of, and supported by metal, asbestos, gypsum, or other noncombustible materials.

2. Masonry Non-Combustible

Exterior walls constructed of masonry materials (as described in Paragraph **C.**) and floors and roof of metal or other non-combustible materials.

3. Fire Resistive

Exterior walls and floors and roof constructed of masonry or other fire resistive materials.

E. Mixed (Masonry/Frame)

A combination of both frame and masonry construction shall be classed and coded as frame when the exterior walls of frame construction (including gables) exceed 33 1/3% of the total exterior wall area; otherwise class as masonry.

RULE 107.
SINGLE AND SEPARATE BUILDINGS DEFINITION

A. Single Building

All buildings or sections of buildings which are accessible through unprotected openings shall be considered as a single building.

B. Separate Building

1. Buildings which are separated by space shall be considered separate buildings.

2. Buildings or sections of buildings which are separated by:

a. A 6 inch reinforced concrete or an 8 inch masonry party wall; or

b. A documented minimum two hour non-combustible wall which has been laboratory tested for independent structural integrity under fire conditions;

which pierces or rises to the underside of the roof and which pierces or extends to the innerside of the exterior wall shall be considered separate buildings. Accessibility between buildings with independent walls or through masonry party walls described above shall be protected by at least a Class A Fire Door installed in a masonry wall section.

RULE 108. – 200.
RESERVED FOR FUTURE USE

© Insurance Services Office, Inc., 2003

PART II
SERVICING TYPE RULES

RULE 201.
POLICY PERIOD

The policy may be written for a period of:

A. One year and may be extended for successive policy periods by extension certificate based upon the forms, premiums and endorsements then in effect for the company.

B. Three years prepaid at three times the annual premium.

C. Three years in annual installments. Each annual installment shall be the annual premium then in effect for the company. Use Deferred Premium Payment Endorsement **DP 04 32.**

For maintaining common anniversary dates, a policy may be written for a period less than one year or less than three years on a pro rata basis.

RULE 202.
CHANGES OR CANCELLATIONS

If insurance is increased, cancelled or reduced, the additional or return premium shall be computed on a pro rata basis, subject to the minimum premium.

RULE 203.
MANUAL PREMIUM REVISION

A manual premium revision shall be made in accordance with the following procedures:

A. The effective date of such revision shall be as announced.

B. The revision shall apply to any policy or endorsement in the manner outlined in the announcement of the revision.

C. Unless otherwise provided at the time of the announcement of the premium revision, the revision shall not affect:

1. In-force policy forms, endorsements or premiums, until the policy is renewed; or

2. In the case of a Deferred Premium Payment Plan, in-force policy premiums, until the anniversary following the effective date of the revision.

RULE 204.
MULTIPLE LOCATIONS

A policy may be issued to provide insurance at more than one Described Location in the same state provided:

A. The same form and deductible applies at each location;

B. A separate policy Declarations page is completed for each location; or

C. The policy Declarations page is completed by:

1. Showing the total policy premium for all locations in the premium payments section.

2. Showing the deductible by entry of the deductible amount and adding "at each location".

3. Inserting the form number that applies.

4. Adding an appropriate reference to the Additional Dwelling Declarations or company equivalent.

RULE 205.
MULTIPLE POLICIES

A. Application

Insurance may be provided on the same property under two or more Dwelling policies in one or more companies as follows:

1. The same form and endorsements must apply to all policies.

2. The same deductible amount must apply to all policies.

B. Endorsement

Use Premium Sharing – Two Or More Policies Endorsement **DP 04 30.**

C. Premium

The premium for each policy is developed as follows:

1. Compute the premium for the total limits of liability from the manual of the company issuing each policy.

2. Allocate the premium determined in Paragraph **1.** based on the ratio of each policy's limit of liability to the total limits of liability for all policies.

© Insurance Services Office, Inc., 2014

RULE 205.
MULTIPLE POLICIES (Cont'd)

D. Example

The following example is a premium computation between two companies using a $50,000 Coverage **A** Limit. The premiums shown are only for illustration.

Each Company's	Company A	Company B
Percentage share	70%	30%
Premium for $50,000 Cov. **A**	$240	$200
Each Company's Policy Premium	168 (70% of 240)	60 (30% of 200)
Total Premium	(168 + 60) = 228	

Table 205.D. Example

RULE 206.
MINIMUM PREMIUM

A. For prepaid policies a minimum **annual** premium shall be charged for each policy.

B. When policies are written under a premium payment plan, no payment shall be less than the minimum premium for each annual period.

C. The minimum premium may include all chargeable endorsements or coverages for Fire or Fire and Allied Lines if written at inception of the policy.

D. The minimum annual premium shall **not** include charges for Theft or Earthquake Coverage, except when Earthquake is the only peril covered under the policy.

E. Refer to company for minimum premium.

RULE 207.
TRANSFER OR ASSIGNMENT

Subject to the consent of the company, all rules of this Manual and any necessary adjustments of premium, a policy may be endorsed to effect:

A. Transfer to another location within the same state; or

B. Assignment from one insured to another in the event of transfer of title of the dwelling.

RULE 208.
WAIVER OF PREMIUM

A. When a policy is endorsed after the inception date, an amount of additional or return premium may be waived.

B. Refer to company for amount that may be waived.

RULE 209.
WHOLE DOLLAR PREMIUM RULE

Each premium shown on the policy and endorsements shall be rounded to the nearest whole dollar. A premium of fifty cents ($.50) or more shall be rounded to the next higher whole dollar.

In the event of cancellation by the company, the return premium may be carried to the next higher whole dollar.

RULE 210.
REFER TO COMPANY

Refer to company for:

A. Rating or classifying any risk for which there is no manual rate.

B. Situations where a portion of the property coverage is reinsured on a facultative basis.

The following rating procedure is available for the determination of the applicable premium:

1. Manual rules and rates shall apply to the portion of the property limit of liability retained by the company.

2. For any portion of the limit(s) of liability obtained by means of facultative reinsurance, the premium shall be the facultative cost for such insurance increased by a charge up to but not exceeding 50% of the facultative cost.

With respect to premium developed in accordance with this Paragraph **2.,** the company is responsible for maintaining complete files, including all details relating to selection of the premium charge.

Whenever a risk is rated on a refer-to-company basis each company is responsible for complying with regulatory or statutory rate filing or disclosure requirements.

Note

Rates shall not be inadequate, excessive or unfairly discriminatory.

RULE 211.
ADDITIONAL INSURED

A. Coverage Description

1. In addition to the named insured shown in the Declarations, another person or organization may be considered an insured in this policy with respect to Coverage **A** – Dwelling and Coverage **B** – Other Structure at the Described Location listed in the Schedule, or elsewhere in the policy. The interest of such persons or organization and the Described Location to which it applies may be acknowledged by naming them in the endorsement referenced in Paragraph **C.**

2. Such persons or organizations are entitled to receive notification if the policy is canceled or nonrenewed by the insurer.

© Insurance Services Office, Inc., 2014

RULE 211.
ADDITIONAL INSURED (Cont'd)

B. Premium Computation

No additional charge is made for use of this endorsement.

C. Endorsement

Use Additional Insured Endorsement **DP 04 41.**

RULES 212. – 300.
RESERVED FOR FUTURE USE

PART III
BASE PREMIUM COMPUTATION RULES

RULE 301.
BASE PREMIUM COMPUTATION

To compute the Base Premium, use the Key Premiums and Key Factors that are displayed in Rule **301.** Refer to state company rates/ISO loss costs.

A. Fire (All Forms), Extended Coverage (DP 00 01), Broad Form (DP 00 02), Or Special Form (DP 00 03) For Coverage A – Dwelling/Coverage C – Personal Property

1. From the Key Premium Table in this Manual, select the Key Premium for the classifications or coverages that apply to the risk.

2. From the Key Factor Table in this Manual, determine the Key Factor for the desired limit of liability. If the desired limit of liability is not shown in the table, **interpolate** as illustrated in Paragraph **B.** of this rule.

3. Multiply the Key Premium by the Key Factor and round to the nearest whole dollar to develop the Base Premium ($.50 or more rounded to the next higher whole dollar).

B. Interpolation Example

1. When the desired limit of liability is **less** than the highest limit shown, interpolate the Key Factors using the nearest limit above and below the desired limit, for example:

a. $25,500 desired limit; the nearest limits are $25,000 and $26,000.

b. For $25,000 the Key Factor is 1.082; for $26,000 the Key Factor is 1.098. Figure the difference between the two Key Factors and divide by 10. This provides a factor per $100.

$$\begin{array}{r} 1.098 \\ -\ 1.082 \\ \hline .016 \end{array} \div 10 = .0016$$

c. Multiply the factor per $100 times five, and add 1.082: the Key Factor for $25,000:

$$\begin{array}{r} .0016 \\ \times\ 5 \\ \hline .0080 \end{array} + 1.082 = 1.090$$

d. The result, 1.090, is the Key Factor for this example.

2. The factors shown in the interpolation example are for illustration only and are not necessarily the factors shown in the Key Factor Table of this Manual.

RULE 302.
VANDALISM AND MALICIOUS MISCHIEF – DP 00 01

Develop the Base Premium by multiplying the same limit of liability selected for Extended Coverage by the Vandalism and Malicious Mischief rate. Refer to state company rates/ISO loss costs.

RULE 303.
ORDINANCE OR LAW COVERAGE – ALL FORMS

A. Applicability By Form

1. DP 00 01

Coverage is **not** automatically included in this form but may be added by endorsement. See Paragraph **B.** for rating instructions.

2. DP 00 02 And DP 00 03

A limited amount of coverage is automatically included at each Described Location to pay for the increased costs necessary to comply with the enforcement of an ordinance or law. This amount is equal to 10% of the limit of liability that applies to:

a. Coverage **A** or Unit-owner Building Items if the insured is an owner of a Described Location; or

b. Coverage **B** if the insured is an owner of a Described Location which is not insured for Coverage **A** or Unit-owner Building Items; or

c. Improvements, Alterations and Additions if the insured is a tenant of a Described Location.

This amount may be increased by endorsement. See Paragraph **B.** for rating instructions.

© Insurance Services Office, Inc., 2014

RULE 303.
ORDINANCE OR LAW COVERAGE – ALL FORMS
(Cont'd)

B. New Or Increased Coverage

1. Ordinance Or Law Coverage

The policy may be endorsed to add (Form **DP 00 01**) or increase (Form **DP 00 02/DP 00 03**) basic Ordinance or Law Coverage to accommodate the increased costs known or estimated by the insured for material and labor to repair or replace the damaged property and to demolish the undamaged portion of damaged property and clear the site of resulting debris according to the ordinance or law.

2. Endorsement

For Form **DP 00 01,** use Ordinance Or Law Coverage Endorsement **DP 04 74.** For Form **DP 00 02** or **DP 00 03,** use Ordinance Or Law – Increased Amount Of Coverage Endorsement **DP 04 71.**

3. Premium Determination

a. Described Location Including Coverage A

(1) Form DP 00 01

(a) Fire And Extended Coverage

The premium is computed by multiplying the Base Premium by the appropriate factor selected from the following table:

Percentage Of Coverage A	
Total Amount	**Factors**
10%	1.03
25%	1.08
50%	1.15
75%	1.23
100%	1.30
For each add'l 25% increment, add:	.08

Table 303.B.3.a.(1)(a) Factors

(b) Vandalism And Malicious Mischief

Multiply the rate per $1,000 used to determine the Vandalism and Malicious Mischief Base Premium by the dollar amount of coverage added. Then multiply the result by .30.

(2) DP 00 02 Or DP 00 03 – Fire, Broad Or Special Forms

The premium is computed by multiplying the Base Premium by the appropriate factor selected from the following table:

Percentage Of Coverage A		
Increase In Amount	**Total Amount**	**Factors**
15%	25%	1.05
40%	50%	1.12
65%	75%	1.20
90%	100%	1.27
For each add'l 25% increment, add:		.08

Table 303.B.3.a.(2) Factors

b. Described Location Not Including Coverage A, But Including Coverage B – Specific Structures, Unit-owner Building Items, And/Or Improvements, Alterations And Additions

See Rule **503.** for rating instructions.

RULE 304.
PERMITTED INCIDENTAL OCCUPANCIES

A. Coverage Description

1. One of the incidental occupancies described in Paragraph **B.** is permitted in a premises eligible for coverage under a Dwelling Policy, if:

a. The policy provides insurance under Coverage **A, B** or **C;**

b. The incidental occupancy is operated by the insured who is the owner or a resident of the premises; and

c. There are no more than two persons at work in the incidental occupancy.

2. Use Permitted Incidental Occupancies Endorsement **DP 04 20.**

B. Permitted Incidental Occupancies

1. Offices, Schools or Studios meaning offices for business or professional purposes, and private schools or studios for music, dance, photography and other instructional purposes.

2. Small Service Occupancies meaning occupancies primarily for service rather than sales. For example: barber or beauty shop, tailor or dressmaker, telephone exchanges or shoe repair shops using handwork only.

3. Storage of merchandise if the value of the merchandise does not exceed $10,000.

© Insurance Services Office, Inc., 2014

RULE 304.
PERMITTED INCIDENTAL OCCUPANCIES (Cont'd)

C. Amount Of Insurance

The amounts of insurance for the contents of the incidental occupancy and merchandise in storage shall be stated as separate contents items in the policy Declarations.

D. Premium Computation

Determine the Coverage **C** Base Premium under Rule **301.,** using the single Key Factor for the total amount of insurance for:

1. Household personal property,
2. Contents of the incidental occupancy, and
3. Merchandise in storage.

RULE 305.
LOSS SETTLEMENT OPTIONS

A. Functional Replacement Cost Loss Settlement – Forms DP 00 02 And DP 00 03 Only

1. Introduction

The policy provides building loss settlement on a replacement cost basis if, at the time of loss, the amount of insurance on the damaged building represents at least 80% of the full replacement cost of the building immediately before the loss.

2. Coverage Description

The policy may be endorsed to provide building loss settlement exclusively on a functional replacement cost basis if, at the time of loss, the amount of insurance on the damaged building is 80% or more of the functional replacement cost of the building immediately before the loss. Functional Replacement Cost means the amount which it would cost to repair or replace the damaged building with less costly common construction materials and methods which are functionally equivalent to obsolete, antique or custom construction materials and methods.

3. Premium Computation

Develop the Base Premium in accordance with Rule **301.** for the amount of insurance selected for this option.

4. Endorsement

Use Functional Replacement Cost Loss Settlement Endorsement **DP 05 30.**

B. Actual Cash Value Loss Settlement – Forms DP 00 02 And DP 00 03 Only

1. Introduction

The policy provides building loss settlement on a replacement cost basis if, at the time of loss, the amount of insurance on the damaged building represents at least 80% of the full replacement cost of the building immediately before the loss.

2. Coverage Description

The policy may be endorsed to provide building loss settlement exclusively on an actual cash value basis if, on the inception date of the policy, the Coverage **A** limit of liability selected by the insured is less than 80% of the full replacement cost of the dwelling.

3. Premium Computation

The premium is computed by multiplying the Base Premium by the appropriate factor from the following table:

Coverage A Limit Of Liability Equals Less Than_____% Of Replacement Value	Factor
80%, but not less than 50%	1.05
Less than 50%	1.10

Table 305.B.3. Factors

4. Endorsement

Use Actual Cash Value Loss Settlement Endorsement **DP 04 76.**

RULES 306. – 400.
RESERVED FOR FUTURE USE

© Insurance Services Office, Inc., 2014

PART IV
ADJUSTED BASE PREMIUM COMPUTATION RULES

RULE 401.
SUPERIOR CONSTRUCTION

A. Introduction

Refer to the Construction Definition rule in this Manual for details.

B. Extended Coverage Rating Classification

For Extended Coverage rating purposes a dwelling classified as:

1. Fire Resistive is considered Wind Resistive.
2. Masonry Non-Combustible is considered Semi-Wind Resistive.

C. Premium Computation

Multiply the Masonry Base Premium by the appropriate factor selected from the following table:

Classifications	Fire	E.C., Broad & Special Forms
Fire Resistive & Masonry Non-Combustible	.50	.50
Non-Combustible	.50	1.00

Table 401.C. Superior Construction Factors

RULE 402.
COVERAGE C – PERSONAL PROPERTY IN BUILDINGS SUBJECT TO COMMERCIAL CLASS RATES OR SPECIFIC RATES

A. Fire

If the building is classified in Division Five of the Commercial Lines Manual – Fire And Allied Lines, Rule **85.,** Paragraph **B.1., B.2., B.3.** or **B.4.,** use the appropriate factor selected from the following table:

Types Of Construction	B.1. Or B.2.*	All Other B.2. Classifications, B.3., B.4. Or Is Rated Specifically
1. Fire Resistive, Masonry Non-Comb. & Non-Comb. Multiply the Masonry Coverage **C** Base Premium by:	.50	1.00
2. All Other Construction Multiply the Masonry Coverage **C** or Frame Base Premium by:	1.00	2.00
* Hotels and Motels Without Restaurant Only		

Table 402.A. Coverage C – Personal Property In Buildings

B. Extended Coverage, Vandalism And Malicious Mischief, Broad Or Special Form

Multiply the Coverage **C** Base Premium by 1.00.

RULE 403.
DWELLING UNDER CONSTRUCTION

A. Coverage Description

Two methods are provided for insuring this exposure.

1. **Named Insured Is The Intended Occupant**

   A builder (contractor) may be designated as an additional insured. The policy may be cancelled upon completion of the dwelling. Use Dwelling Under Construction Endorsement **DP 11 43.**

2. **Named Insured Is Not The Intended Occupant**

   The policy shall specify building is in course of construction and permission is granted to complete.

   For other coverage bases, refer to the Commercial Lines Manual.

B. Premium Computation

1. Multiply the Coverage **A** Owner Occupied Base Premium by .65.
2. Multiply the Coverage **A** Non-Owner Occupied Base Premium by 1.00.

RULE 404.
MOBILE OR TRAILER HOMES – DP 00 01 ONLY

Refer to the state company rates/ISO loss costs.

Rule **410.** does not apply to Mobile or Trailer homes.

RULE 405.
TOWNHOUSE OR ROWHOUSE

A. Individual Family Units

Determine the total number of individual family units within a Fire Division. For example, a two family dwelling attached to a one family dwelling is considered **three** individual family units within a Fire Division if both dwellings are not separated by a fire wall. Four attached two family dwellings are considered **eight** individual family units within a Fire Division if they are not separated by fire walls. A policy may be issued for:

1. Coverage **A** when the dwelling contains one, two, three or four individual family units within a Fire Division.
2. Coverage **C** in a dwelling with one or more individual family units within a Fire Division.

© Insurance Services Office, Inc., 2014

RULE 405.
TOWNHOUSE OR ROWHOUSE (Cont'd)

B. Premium Computation

Number Of Individual Family Units	Use Coverage A∗ Or C Base Premium
1, 2, 3 or 4	1, 2, 3 or 4 families
5 or more	5 or more families
∗ Refer to Commercial Lines Manual for Building Coverage when it contains five or more individual family units within a Fire Division	

Table 405.B. Townhouse Or Rowhouse

RULE 406.
DEDUCTIBLES

All policies are subject to a deductible that applies to loss from all perils except Earthquake. A separate deductible type applies to Earthquake Coverage as described in Rule **509.**

For Theft Coverage, the deductible amount may differ from the deductible amount that applies to Fire and Allied Lines perils.

Refer to the Earthquake and Theft Coverage rules for the applicable deductible provision.

A. Base Deductible

$500 Deductible.

B. Optional Deductibles

1. All Perils Deductibles

To compute the premium for these options, multiply the Base Premium for the Base Deductible by the factors selected from the state exception pages.

2. Windstorm Or Hail Deductibles

When the policy covers the peril of Windstorm or Hail, the following deductible options may be used in conjunction with a deductible applicable to all other perils covered under Extended Coverage, Broad or Special Forms.

a. Percentage Deductibles

(1) Deductible Amounts

This option provides for higher Windstorm or Hail percentage deductibles of 1%, 2%, 5%, 7.5% and 10% of the limit of liability that applies to Coverage **A, B, D** or **E,** whichever is greatest, when the dollar amount of the percentage deductible selected exceeds the amount of the All Other Perils deductible. This option is not available for policies covering only personal property.

(2) Endorsement

Use Windstorm Or Hail Percentage Deductible Endorsement **DP 03 12.**

(3) Declarations Instructions

Enter, on the policy Declarations, the percentage amount that applies to Windstorm or Hail and the dollar amount that applies to All Other Perils. For example:

Deductible – Windstorm or Hail 2% of the Coverage **A** limit and $500 for All Other Perils.

(4) Deductible Application

In the event of a Windstorm or Hail loss to covered property, the dollar amount is deducted from the total of the loss for all coverages.

(5) Coverage Options

The deductible factors for Coverage **A, B, D** or **E** and coverage options for buildings and non-building structures differ by the deductible percentage amounts that apply to Windstorm or Hail, deductible amounts that apply to other perils, and the Coverage **A, B, D** or **E** limit.

The deductible factors for Coverage **C** and other personal property coverage options differ by the deductible percentage amounts that apply to Windstorm or Hail and the deductible amounts that apply to other perils.

(6) Use Of Factors

The factors for the Windstorm or Hail Deductibles incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Windstorm or Hail deductible.

(7) Deductible Factors

To compute the premium for this provision, multiply the Extended Coverage, Broad or Special Form Base Premium for the Base Deductible for each coverage insured under the policy by the factor selected from the state exception pages.

© Insurance Services Office, Inc., 2014

RULE 406.
DEDUCTIBLES (Cont'd)

b. Higher Fixed-dollar Deductibles

(1) Deductible Amounts

This option provides for higher Windstorm or Hail fixed-dollar deductible amounts of $1,000, $2,000, $5,000, $7,500 and $10,000 when the dollar amount of the higher fixed-dollar deductible selected exceeds the amount of the All Other Perils deductible. This option is not available for policies covering only personal property.

(2) Endorsement

An endorsement is not required.

(3) Declarations Instructions

Separately enter, on the policy Declarations, the deductible amounts that apply to Windstorm or Hail and All Other Perils. For example: $1,000 for Windstorm or Hail and $500 for All Other Perils.

(4) Deductible Application

In the event of a Windstorm or Hail loss to covered property, the dollar amount is deducted from the total of the loss for all coverages.

(5) Coverage Options

The deductible factors for Coverage **A, B, D** or **E** and coverage options for buildings and non-building structures differ by the deductible amounts that apply to Windstorm or Hail and to other perils and the Coverage **A, B, D** or **E** limit.

The deductible factors for Coverage **C** and other personal property coverage options differ by the deductible amounts that apply to Windstorm or Hail and other perils.

(6) Use Of Factors

The factors for the Windstorm or Hail Deductibles incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Windstorm or Hail deductible.

(7) Deductible Factors

To compute the premium for this provision, multiply the Extended Coverage, Broad or Special Form Base Premium for the Base Deductible for each coverage insured under the policy by the factor selected from the state exception pages.

RULE 407.
AUTOMATIC INCREASE IN INSURANCE

A. Coverage Description

The policy may be endorsed to provide automatic annual increases in the Coverage **A** and **B** limits of liability.

B. Premium Computation

1. The premium is computed by multiplying the Base Premium by the appropriate factors selected from the following table as follows:

Amount Of Annual Increase	Factor
4%	1.02
6%	1.03
8%	1.04
Each Add'l 4% over 8% add:	.02

Table 407.B.1. Factors

2. The premium for a three-year policy is 3.2 times the annual policy premium.

C. Endorsement

Use Automatic Increase In Insurance Endorsement **DP 04 11.**

© Insurance Services Office, Inc., 2014

RULE 408.
PROTECTIVE DEVICES

A. Protective Devices Factors

Approved and properly maintained installations of fire alarms and automatic sprinklers in the dwelling may be recognized for a reduced premium – computed by multiplying the Fire Base Premium by the selected factors below:

Protective Devices Factors

Type Of Installation*	Dwelling Factor	Mobile Or Trailer Home Factor
Central Station Reporting Fire Alarm	.90 to 1.00	.92 to 1.00
Fire Department Reporting Fire Alarm	.93 to 1.00	.95 to 1.00
Local Fire Alarm	.95	.97
Automatic Sprinklers In All Areas Including Attics, Bathrooms, Closets, Attached Structures	.80 to .90	.90 to .95
Automatic Sprinklers In All Areas Except Attic, Bathroom, Closet And Attached Structure Areas That Are Protected By A Fire Detector	.90 to 1.00	.95 to 1.00
* Refer to company for eligibility, types of systems and devices, installations, and available credits		

Table 408.A. Protective Devices Factors

B. Endorsement

Use Premises Alarm Or Fire Protection System Endorsement **DP 04 70.**

RULE 409.
ACTUAL CASH VALUE LOSS SETTLEMENT WINDSTORM OR HAIL LOSSES TO ROOF SURFACING – DP 00 02, DP 00 03 AND DP 00 01 WITH DP 00 08

A. Introduction

The policy provides settlement for building losses on a repair or replacement cost basis, subject to certain conditions.

B. Coverage Description

The policy may be endorsed to provide loss settlement exclusively on an Actual Cash Value basis for roof surfacing when damage is caused by the peril of Windstorm or Hail.

C. Premium Determination

To develop a premium for this option, multiply the Extended Coverage, if applicable, and Broad or Special Form Base Premium by a factor of .98.

D. Endorsement

Use Actual Cash Value Loss Settlement Windstorm Or Hail Losses To Roof Surfacing Endorsement **DP 04 75.**

RULE 410.
BUILDING CODE EFFECTIVENESS GRADING

This rule does not apply to Mobile or Trailer homes.

A. General Information

1. The Building Code Effectiveness Grading Schedule (BCEGS) develops a grade of 1 to 10 for a community based on the adequacy of its building code and the effectiveness of its enforcement of that code. Policies which cover the perils of Windstorm or Hail or Earthquake may be eligible for special rating treatment, subject to the criteria in the following paragraphs. The BCEGS factor applies, where applicable, in addition to the Public Protection Classification factors.
2. In some communities, two BCEGS classifications may be assigned. One classification for personal lines indicated next to "PERS" will apply to one- and two-family dwelling buildings and/or personal property contained in such buildings. The other classification indicated next to "COML" will apply to all other buildings occupied for residential, commercial and/or manufacturing purposes, including personal and business property contained therein. The ISO Community Mitigation Classifications will indicate the application of each grade.
3. Refer to the ISO Community Mitigation Classifications (CMC) Manual for the BCEGS classifications for a community and their effective dates.

B. Community Grading

1. The BCEGS classification applies to any building that has an original certificate of occupancy dated the year of the effective date of the community grading, or later. A rating factor has been developed for each community classification.
2. If a community is regraded subsequent to its initial grading, the factor for the revised grade applies to buildings that have an original certificate of occupancy dated the year of the effective date of the revised grading, or later.
3. Where certificates of occupancy are not issued, equivalent documentation acceptable to the company may be used.
4. If, due to an addition or alteration, the original building is changed to comply with the latest building code, the factor for the community classification applicable at the time the reconstruction is completed will apply to such building.

© Insurance Services Office, Inc., 2014

RULE 410.
BUILDING CODE EFFECTIVENESS GRADING (Cont'd)

5. The BCEGS classification may apply to Windstorm or Hail or Earthquake, or to both. Specific information is provided in the ISO Community Mitigation Classifications (CMC) Manual. If the grade in the manual does not apply to one of the perils, the factor should not be applied for that peril.

C. Individual Grading

Where buildings have been built in full conformance with the natural hazard mitigation elements of one of the nationally recognized building codes even though the community grade is greater than one, exception rating procedures may apply.

1. Any building may be classified as a 1 for Windstorm or Hail upon certification by a registered or licensed design professional, based on an on-site inspection, that such building is in compliance with one of the three nationally recognized building codes with respect to mitigation of the windstorm or hail hazard. This classification is effective only from the date of the certification.

2. Any building may be classified as a 1 for Earthquake upon certification by a registered or licensed design professional, based on an on-site inspection, that such building is in compliance with the earthquake mitigation elements of one of the three nationally recognized building codes. This classification is effective only from the date of the certification.

D. Ungraded Risks

Buildings which do **not** meet the criteria in Paragraph **B.** or **C.** for classification assignment are rated and coded as ungraded risks. Do not classify as a 10.

E. Premium Credit Computation

1. Community Grading

a. Windstorm Or Hail

Compute the premium credit as follows:

(1) For buildings which are eligible under Paragraph **B.** of this rule, and for personal property inside such buildings, multiply the Key Premium for Extended Coverage **(DP 00 01)** by the applicable factor in Paragraph **E.1.c.(1);** and

(2) Multiply the result from Paragraph **(1)** by the Key Factor for the desired amount of insurance.

b. Earthquake

When Earthquake Endorsement **DP 04 69** is attached to the policy, multiply the Earthquake Base Premium by the appropriate factor in Paragraph **E.1.c.(2)** located in the state exceptions.

c. Credit Factors

Refer to state exceptions for state-specific factors.

2. Individual Grading

For any building classified as a 1 based upon certification as set forth in Paragraph **C.,** use the appropriate factor listed under Paragraph **E.1.c.** located in the state exceptions.

RULES 411. – 499.
RESERVED FOR FUTURE USE

© Insurance Services Office, Inc., 2014

PART V
ADDITIONAL COVERAGES AND INCREASED LIMITS RULES

RULE 500.
MISCELLANEOUS LOSS COSTS

This rule is reserved to provide rates for various rating rules in this Manual. Refer to state company rates/ISO loss costs.

RULE 501.
COVERAGE B – OTHER STRUCTURES

A. Coverage Description

Coverage for other structures described as covered under Coverage **B** is automatically provided on a blanket basis for up to 10% of the Coverage **A** limit.

1. Under Form **DP 00 01,** use of this option reduces the Coverage **A** limit for the same loss.
2. Under Form **DP 00 02** or **DP 00 03,** this limit is additional insurance.

The blanket limit may not be increased.

No entry is needed in the policy Declarations for this coverage to apply.

B. Specific Structures Coverage

Coverage may be purchased for specific structures. Enter the limit of liability and description of each structure in the policy Declarations. Refer to Paragraph **C.** for premium computation instructions.

C. Premium Computation

1. **Structure Rented To Others For Dwelling Purposes**

   Rate each structure separately as a Coverage **A** Dwelling, Non-Owner-Occupied under Rule **301.**

2. **Structure Not Rented To Others For Dwelling Purposes**

   a. Policy includes Coverage **A** or structure does not have permitted incidental occupancy or is at same Described Location as the dwelling:

   (1) Fire, Extended Coverage, Broad And Special Forms

   Refer to the state company rates/ISO loss costs Rule **500.** Miscellaneous Rates.

   (2) Vandalism And Malicious Mischief (DP 00 01)

   Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

   b. Policy does not include Coverage **A** or structure has permitted incidental occupancy or is not at same Described Location as the dwelling:

   (1) Fire, Extended Coverage, Broad And Special Forms

   Rate each structure separately as a Coverage **A** item under Rule **301.** using the one Family Key Premium.

   (2) Vandalism And Malicious Mischief (DP 00 01)

   Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

RULE 502.
COVERAGE D – FAIR RENTAL VALUE
COVERAGE E – ADDITIONAL LIVING EXPENSE

A. Introduction

Coverage is automatically provided in the forms on a limited basis as follows:

1. **Form DP 00 01**

   a. Coverage D

   Up to 20% of the Coverage **A** limit is available. Use of this option reduces the Coverage **A** limit for the same loss. No entry is needed in the policy Declarations for this coverage to apply.

   b. Coverage E

   Not automatically included in form. It may be added as noted in Paragraph **B.**

2. **Form DP 00 02 Or DP 00 03**

Coverage **D** and **E** combined – Up to 20% of the Coverage **A** limit is available for Coverage **D** and Coverage **E** combined as additional insurance. No entry is needed in the policy Declarations for this coverage to apply.

B. Coverage Description

Coverage may be increased or added as follows for all forms:

1. **Coverage D**

   a. The amount recoverable each month under this coverage shall be based on the lost rental income less any expenses that do not continue during untenability.

   b. Enter amount of increase in the policy Declarations.

   c. For **DP 00 01,** the amount recoverable each month is limited to a fraction of the total rental value amount insured under the policy. This fraction is equal to one divided by the number of months dwelling is rented per year.

© Insurance Services Office, Inc., 2014

RULE 502.
COVERAGE D – FAIR RENTAL VALUE
COVERAGE E – ADDITIONAL LIVING EXPENSE (Cont'd)

DP 00 01 Example

Factors		
$10,000	=	Rental Value Coverage in Form (20% of Coverage **A** limit of $50,000)
+2,000	=	Additional Insurance (Shown under Coverage **D** in policy Declarations)
$12,000	=	Total Rental Value Amount Insured
Scenario A		
If dwelling is rented for entire year, then fraction = 1/12. $12,000 X 1/12 = Up to $1,000 available each month.		
Scenario B		
If dwelling is rented 8 months per year, then fraction = 1/8. $12,000 X 1/8 = Up to $1,500 available each month.		

Table 502.B.1.c. DP 00 01 Example

2. Coverage E

a. Enter initial limit **(DP 00 01)** or amount of increase **(DP 00 02** or **DP 00 03)** in policy Declarations.

b. For **DP 00 01,** the amount recoverable each month is limited to no more than 25% per month of the total additional living expense amount insured under the policy.

c. For **DP 00 01,** use Additional Living Expense Endorsement **DP 04 14.**

C. Premium Computation

1. Policy Includes Coverage A Or Coverage C

a. Fire, Extended Coverage, Broad And Special Forms

Refer to the state company rates/ISO loss costs Rule **500.** Miscellaneous Rates.

b. Vandalism And Malicious Mischief (DP 00 01)

Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

2. Policy Does Not Include Coverage A Or Coverage C

a. Fire, Extended Coverage, Broad And Special Forms

(1) One To Four Family Dwelling

Multiply the Coverage **A** Key Premium by the Coverage **A** Key Factor, for:

(a) The Coverage **D** limit, times .53; or

(b) The Coverage **E** limit, times 1.00

(2) Five Or More Family Dwelling

Calculate the premium as instructed above using the Four Family Key Premium.

b. Vandalism And Malicious Mischief (DP 00 01)

Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

RULE 503.
ORDINANCE OR LAW COVERAGE FOR COVERAGE B – SPECIFIC STRUCTURES, BUILDING ITEMS AND IMPROVEMENTS, ALTERATIONS AND ADDITIONS

A. Coverage Description

1. DP 00 01

The policy may be endorsed to add an amount of Ordinance or Law Coverage equal to the amounts noted in Paragraphs **1.** and **2.**

2. DP 00 02 Or DP 00 03

The basic 10% of coverage may be initially increased to the amounts noted in Paragraphs **A.2.a.** and **b.**

a. 50% of the total Coverage **B** or Unit-owner Building Items limit; or

b. 100% of the Improvements, Alterations and Additions limit.

B. Increased Limits

These amounts may be further increased in 25% increments.

C. Premium Determination

1. The premium for this additional coverage is determined based on the dollar amount of coverage added for **DP 00 01,** or the dollar amount of increase, represented by the increased percentage selected above the basic limit for **DP 00 02** or **DP 00 03.**

2. Multiply state company rates/ISO loss costs Rule **500.** Miscellaneous Rates by .30.

© Insurance Services Office, Inc., 2014

RULE 504. IMPROVEMENTS, ALTERATIONS AND ADDITIONS TENANT AND CO-OP UNIT-OWNER – DP 00 01 OR DP 00 02

A. Introduction

Named perils coverage is automatically provided in the forms for up to 10% of the Coverage **C** limit.

1. DP 00 01

Use of this option reduces the Coverage **C** limit for the same loss.

2. DP 00 02

This limit is additional insurance.

This limit may be increased for an additional premium.

B. Special Coverage

For Form **DP 00 02,** coverage may be extended to Special Coverage for an additional premium.

C. Stand Alone Coverage

Coverage may be written without Coverage **A, B, C, D** or **E.**

D. Premium Computation

1. Fire, Extended Coverage, Broad And Special Forms

a. If the policy includes Coverage **A, B, C, D** or **E,** refer to the state company rates/ISO loss costs Rule **500.** Miscellaneous Rates.

b. If the policy does not include Coverage **A, B, C, D** or **E,** multiply the Coverage **A.,** Four Family, Owner-occupied Key Premium (for the territory, protection and construction applying to the Described Location) by the Coverage **A** Key Factor for the amount of insurance desired.

2. Vandalism And Malicious Mischief (DP 00 01)

Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

E. Endorsement

1. To provide Named Perils Coverage, use Improvements, Alterations And Additions Endorsement **DP 04 31.**

2. To provide Special Coverage, use Improvements, Alterations And Additions Endorsement **DP 04 31** and Special Coverage Endorsement **DP 04 65.**

RULE 505. BUILDING ITEMS CONDO UNIT-OWNER – DP 00 01 OR DP 00 02

A. Coverage Description

Unit-owners building items are not covered in the forms.

However, for an additional premium, coverage is available on a Named Perils or Special Coverage basis.

B. Stand Alone Coverage

Coverage may be written without Coverage **A, B, C, D** or **E.**

C. Premium Computation

1. Fire, Extended Coverage, Broad And Special Forms

a. If the policy includes Coverage **A, B, C, D** or **E,** refer to the state company rates/ISO loss costs Rule **500.** Miscellaneous Rates.

b. If the policy does not include Coverage **A, B, C, D** or **E,** multiply the Coverage **A.,** Four Family, Owner-Occupied Key Premium (for the territory, protection and construction applying to the Described Location) by the Coverage **A** Key Factor for the amount of insurance desired.

2. Vandalism And Malicious Mischief (DP 00 01)

Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

D. Endorsement

1. To provide Named Perils Coverage, use Form **DP 00 01** or **DP 00 02** and Unit-owners Coverage Endorsement **DP 17 66.**

2. To provide Special Coverage, use Form **DP 00 02** and Unit-owners Coverage Endorsement **DP 17 66** and Special Coverage Endorsement **DP 04 65.**

© Insurance Services Office, Inc., 2014

RULE 506.
LOSS ASSESSMENT PROPERTY COVERAGE CO-OP OR CONDO UNIT-OWNER OR TENANT – DP 00 01 OR DP 00 02 DWELLING BUILDING OWNER – ALL FORMS

A. Coverage Description

1. Coverage for property loss assessment, for which the insured may be liable, is not included in the forms.
2. Coverage is available for an additional premium for all insured perils.
3. When coverage is desired for the peril of Earthquake, refer to Rule **509.C.** for policy writing and rating instructions.

B. Stand Alone Coverage

Coverage may be written without Coverage **A, B, C, D** or **E.**

C. Endorsement

Use Loss Assessment Property Coverage Endorsement **DP 04 63.**

D. Premium Computation

1. **Fire, Extended Coverage, Broad And Special Forms**
   a. If the policy includes Coverage **A, B, C, D** or **E,** refer to the state company rates/ISO loss costs Rule **500.** Miscellaneous Rates.
   b. If the policy does not include Coverage **A, B, C, D,** or **E,** multiply the Coverage **A.,** Four Family, Owner-Occupied Key Premium (for the territory, protection and construction applying to the described location) by the Coverage **A** Key Factor for the amount of insurance desired.
2. **Vandalism And Malicious Mischief (DP 00 01)**

   Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

RULE 507.
FIRE DEPARTMENT SERVICE CHARGE

The limit of $500 may be increased subject to the rules and rates of the company.

RULE 508.
TREES, SHRUBS AND OTHER PLANTS

A. Form DP 00 01

1. **Coverage Description**

   Coverage for trees, shrubs and other plants is not provided in this form. However, for an additional premium, coverage is available for specified perils on two bases, with and without the peril of windstorm or hail. Coverage is limited to a $500 per item maximum.

   Declare on the endorsement or elsewhere in the policy, as directed by the company, whether the peril of windstorm or hail applies.
2. **Stand Alone Coverage**

   This coverage may be written without Coverage **A, B, C, D** or **E.**
3. **Endorsement**

   Use Trees, Shrubs And Other Plants Endorsement **DP 04 17.**

B. Forms DP 00 02 Or DP 00 03

1. **Coverage Description**

   Up to 5% of the Coverage **A** limit is available in the form (subject to a $500 per item maximum) for specified perils as additional insurance.
2. **Windstorm Or Hail Coverage**

   Coverage for Windstorm or Hail is available up to 5% of Coverage **A** limit (subject to a $500 per item maximum) for an additional premium.
3. **Endorsement**

   Use Windstorm Or Hail Endorsement **DP 04 18.**

© Insurance Services Office, Inc., 2014

RULE 508.
TREES, SHRUBS AND OTHER PLANTS (Cont'd)

C. Premium Computation

1. Fire, Extended Coverage, Broad And Special Forms

Refer to state company rates/ISO loss costs Rule **508.**

2. Vandalism And Malicious Mischief (DP 00 01)

Refer to state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

RULE 509.
EARTHQUAKE COVERAGE

A. Coverage Description

The policy may be endorsed to provide coverage against a loss resulting from the peril of Earthquake. This peril shall apply to all Property Coverages for the same limits provided in the policy. When added to the Fire policy, this peril shall apply to the same coverages and for the same limits that apply to the peril of Fire. Use Earthquake Endorsement **DP 04 69.**

B. Earthquake Only Coverage

When a policy is written to cover only the peril of Earthquake:

1. Use Form **DP 00 01** for Actual Cash Value Loss Settlement or **DP 00 02** for Replacement Cost;

2. Use Earthquake And Volcanic Eruption Endorsement **DP 16 13;** and

3. Multiply the rates in this rule by a **factor** of 1.10.

C. Loss Assessment Coverage

When the policy is extended to cover loss assessment resulting from loss by this peril, the limit of liability shall be based on the insured's proportionate interest in total value of all collectively owned buildings and structures of the corporation or association of property owners. Refer to company for rates. Use Loss Assessment Coverage For Earthquake Endorsement **DP 04 68.**

D. Deductible

Deductible percentage amounts of 5%, 10%, 15%, 20% and 25% of the limit of liability for Coverage **A** and Coverage **C** are included in this rule.

In the event of an Earthquake loss to covered property, the dollar amount is deducted from the total of the loss for Coverages **A, B** and **C.**

Earthquake rates/loss costs are displayed for the 5% and 10% deductible in the state company rates/ISO loss costs Rule **509.** Credit factors for deductible percentage amounts of 15%, 20% and 25% are provided in Paragraph **F.** Premium For Higher Deductibles of this rule.

E. Premium For Base Deductible

Develop the Base Premium as follows:

1. Determine whether Construction Table **A, B,** and/or **C** applies for the appropriate deductible. Refer to state company rates/ISO loss costs.

2. Determine the Earthquake territory according to the ZIP code of the residence premises from the State Territory Definitions section in this manual.

3. Add the results of the following three steps:

a. Multiply the Coverage **A** limit by the state company rates/ISO loss costs for Coverage **A** in the table;

b. Multiply the Coverage **C** limit by the state company rates/ISO loss costs for Coverage **C** in the table; and

c. Multiply the sum of the Additional Coverage **D** and **E** limits by the state company rates/ISO loss costs for Coverages **D** and **E** in the table.

4. For Building or Non-building Structure Items – All Forms:

Multiply the state company rates/ISO loss costs for Coverage **B** in the table by the appropriate limit of liability for the following Other Building Coverage options, as applicable, and add to the applicable premium determined in Paragraph **E.3.**

a. Coverage **B** – Specific Structures;

b. Improvements, Alterations and Additions – Increased Limits;

c. Building Items Coverage;

5. For Ordinance or Law – Basic and Increased Limit – All Forms:

When the basic Ordinance or Law Coverage limit is added or increased, the earthquake premium is developed based on the added or increased limit of insurance.

a. For Forms **DP 00 01, DP 00 02** and **DP 00 03,** multiply the rate determined in Paragraph **E.3.a.** by the appropriate factor selected from Rule **303.B.3.a.**

b. For Coverage **B** – Specific Structures, Improvements, Alterations and Additions and Building Items Coverage, the premium for this additional coverage is determined based on the dollar amount of added or increased coverage, represented by the increased percentage amount selected above the basic limit. The rate for each additional $1,000 of insurance is determined as follows: multiply the state company rates/ISO loss costs for Coverage **B** in the table by .30 and add to the applicable premium determined in Paragraph **E.**

© Insurance Services Office, Inc., 2014

RULE 509.
EARTHQUAKE COVERAGE (Cont'd)

F. Premium For Higher Deductibles

Multiply the Earthquake base premium determined in Paragraph **E.** for the 10% deductible by the appropriate factor from the following table:

Deductible Percentage	Frame	Masonry	Superior
15%	.80	.85	.75
20%	.65	.70	.60
25%	.50	.60	.45

Table 509.F. Higher Deductibles Factors

G. Building Code Effectiveness Grading

Refer to General Rule **410.** Building Code Effectiveness Grading for information which may affect Earthquake rating.

RULE 510.
THEFT COVERAGE

A. Introduction

A Fire policy insuring Coverage **A** or **C** may be extended, for an additional premium, to provide On and Off-Premises Coverage for the perils of Theft and Vandalism and Malicious Mischief (V.&M.M.) resulting from theft.

1. Owner-Occupied Dwellings, Co-Op Or Condo Units; And Apartments Occupied By Tenant (Named Insured)

a. Coverage Description

The policy may be extended to provide On or Off-Premises Coverage.

b. Minimum Limit Of Liability

The minimum limit of liability is $1,000 each for On and Off-Premises Coverage.

c. Off-Premises Coverage

Off-Premises Coverage is **only** available when On-Premises Coverage is purchased.

The limit of liability shall not be greater than that selected for On-Premises Coverage.

d. Endorsement

Use Broad Theft Coverage Endorsement **DP 04 72.**

2. Non-Owner-Occupied Dwellings, Co-op Or Condo Units; And Apartments Occupied By Tenant (Other Than Named Insured)

a. Coverage Description

The policy may be extended to provide On-Premises Coverage **only.**

b. Limit Of Liability

The minimum limit of liability is $1,000.

c. Endorsement

Use Limited Theft Coverage Endorsement **DP 04 73.**

B. Premium Computation

Refer to state company rates/ISO loss costs for the Base Deductible.

Compute the premiums separately for each premises in the manner and sequence that follows:

1. Theft And Vandalism And Malicious Mischief

a. Owner-Occupied Dwellings

Compute the premiums for the desired limit of liability separately for On and Off-Premises Coverage.

b. Non-Owner-Occupied Dwellings, (On-Premises Only)

Multiply the On-Premises premium computed above by a factor of 1.50.

2. Burglar Alarm Discount (On-Premises Only)

a. Approved and properly maintained installations of burglar alarms in the dwelling may be recognized for a reduced premium – developed by applying the selected factors to the premiums computed in Paragraph **B.1.a.** or **B.1.b.**

Type Of Installation*	Factor
Central Station Reporting Burglar Alarm	.95 to 1.00
Police Station Reporting Burglar Alarm	.97 to 1.00
Local Burglar Alarm	.98
* Refer to company for eligibility, types of systems and devices, installations and available credits.	

Table 510.B.2.a. Factors

b. Use Premises Alarm Or Fire Protection System Endorsement **DP 04 70.**

C. Deductibles

1. Base Deductible

$500 Deductible.

© Insurance Services Office, Inc., 2014

RULE 510.
THEFT COVERAGE (Cont'd)

2. Optional Deductibles

To compute the premium for this provision, multiply the premium for the Base Deductible computed in Paragraph **B.1.** by the factor listed in the following table:

Deductible∗	Factor
$ 100	1.26
$ 250	1.05
$ 1,000	.84
$ 2,500	.68
∗ Refer to the state company rates pages for the minimum annual additional premium charge that applies per policy.	

Table 510.C.2 Factors

RULE 511.
SINKHOLE COLLAPSE COVERAGE

A. Coverage Description

The policy may be endorsed to provide Sinkhole Collapse Coverage.

B. Premium Computation

1. Refer to state company rates/ISO loss costs; and

2. Multiply the rate per $1,000 by:

a. Coverage **A, B** and/or **C** amounts of insurance;

b. Improvements, Alterations and Additions – Increased Limits;

c. Other Building or Structure Options (for example, Bldg. Items Coverage);

d. Other Personal Property Coverage Options (for example, Merchandise in Storage); or

e. Ordinance or Law Coverage, basic amount and, if applicable, increased amount of coverage.

C. Endorsement

Use Sinkhole Collapse Endorsement **DP 04 99.**

RULE 512.
WINDSTORM OR HAIL COVERAGE – AWNINGS, SIGNS AND OUTDOOR RADIO AND TELEVISION EQUIPMENT

A. Coverage Description

The peril of Windstorm or Hail does **not** cover:

1. Awnings, Signs and Outdoor Radio and Television Equipment in **DP 00 01** or **DP 00 02;**

2. Outdoor Radio and Television Equipment in **DP 00 03;**

whether or not attached to a Dwelling Building or Other Structure.

B. Premium Computation

Coverage may be provided for an additional premium. Refer to the state company rates/ISO loss costs.

C. Endorsement

Use Windstorm Or Hail – Radio And Television Antennas, Awnings And Signs Endorsement **DP 04 19.**

RULE 513.
LIMITED WATER BACK-UP AND SUMP DISCHARGE OR OVERFLOW COVERAGE

A. Coverage Description

The policy forms exclude coverage for loss resulting from water or waterborne material which backs up through sewers or drains or which overflows or is discharged from a sump, sump pump or related equipment.

When the optional Limited Water Back-up And Sump Discharge Or Overflow Coverage endorsement is attached to the policy, coverage is provided with respect to direct physical loss, not caused by the negligence of an insured, to property covered, caused by water or waterborne material which originates from within the dwelling on the Described Location and backs up through sewers or drains or which overflows or is discharged from a sump, sump pump or related equipment. The basic limit is $5,000. Unless increased limits are selected, the basic limit must be entered on the coverage endorsement or the policy Declarations.

B. Increased Limits

The limit may be increased to $10,000, $15,000, $20,000 or $25,000. The limit selected is entered on the coverage endorsement or the policy Declarations.

C. Premium Computation

Refer to state company rates/ISO loss costs.

D. Endorsement

Use Limited Water Back-up And Sump Discharge Or Overflow Coverage Endorsement **DP 04 95.**

© Insurance Services Office, Inc., 2014

RULE 514.
ASSISTED LIVING CARE COVERAGE

A. Introduction

The policy provides coverage to named insureds and resident relatives who are members of the insured's household.

B. Coverage Description

1. The policy may be endorsed to provide personal property and additional living expense coverage to a person regularly residing in an Assisted Living Care facility, provided such person:
   a. Is related to an insured by blood, marriage or adoption; and
   b. Is not a member of that insured's household.
2. An assisted living care facility is a facility that provides assisted living services such as dining, therapy, medical supervision, housekeeping and social activities. It is **not** a hospice, prison or rehabilitation facility.
3. The endorsement provides the following basic limits of coverage:
   a. $10,000 for Coverage **C** – Personal Property with limitations ranging from $100 to $500 for certain items of property; and
   b. $6,000, at $500 per month, for Additional Living Expenses.

C. Premium

Refer to state company rates/ISO loss costs.

D. Endorsement

Use Assisted Living Care Coverage Endorsement **DP 04 59.**

RULE 515.
MOTORIZED GOLF CART – PHYSICAL LOSS COVERAGE

A. Coverage Description

The policy may be endorsed to provide coverage for physical loss to a motorized golf cart, including permanently installed accessories, equipment and parts, owned by an insured.

Also covered, for an amount equal to 10% of the limit of the highest scheduled cart, are accessories, equipment or parts designed or made solely for the cart that are **not** permanently installed provided such property is at the Described Location or in or upon the cart off the Described Location at the time of loss.

Coverage for loss caused by collision is optional and only applies if declared on the schedule of the endorsement.

B. Eligibility

To be eligible for coverage, the motorized golf cart shall be of the type designed to carry up to four people on a golf course for the purpose of playing golf and shall not have been built, or modified after manufacture, to exceed a speed of 25 m.p.h. on level ground.

Read the endorsement for all conditions of coverage.

C. Limit Of Liability

The limit of liability shall be selected by the insured. However, that limit should be representative of the actual cash value of the motorized golf cart including any permanently installed accessories, etc.

D. Deductible

A $500 deductible replaces any other deductible in the policy with respect to any one loss covered under the endorsement.

E. Premium Computation

Rate each cart separately using the rate per $500 of insurance. Refer to state company rates/ISO loss costs.

F. Endorsement

Use Owned Motorized Golf Cart – Physical Loss Coverage Endorsement **DP 05 28.**

RULE 516.
GRAVEMARKERS

A. Coverage Description

Coverage for gravemarkers, including mausoleums, is not included in the forms. The policy may be endorsed to provide $5,000 in coverage for gravemarkers, including mausoleums, on the Described Location.

B. Premium Computation

1. **Fire, Extended Coverage, Broad And Special Forms**

   Refer to the state company rates/ISO loss costs Rule **500.** Miscellaneous Rates.

2. **Vandalism And Malicious Mischief (DP 00 01)**

   Refer to the state company rates/ISO loss costs Rule **302.** Vandalism And Malicious Mischief.

C. Endorsement

Use Gravemarkers Endorsement **DP 04 58.**

© Insurance Services Office, Inc., 2014

RULE 517.
LIMITED FUNGI, WET OR DRY ROT, OR BACTERIA COVERAGE

A. Coverage Description

When the optional Limited Fungi, Wet Or Dry Rot, Or Bacteria Coverage Endorsement is attached to the policy, limited amounts of insurance are automatically provided as follows:

$10,000, on an aggregate basis, to pay for loss and associated costs to covered real or personal property, owned by an insured, that is damaged by fungi, wet or dry rot, or bacteria on the Described Location as defined in the coverage endorsement. If the basic limit is selected, it is entered on the coverage endorsement or the policy Declarations.

This Coverage applies only for the policy period in which the loss or costs occur.

If more than one location is insured under this policy, enter the address of such locations on this endorsement or the policy Declarations.

B. Increased Limits

Limits may be increased to $25,000 or $50,000. The limit selected is entered on the coverage endorsement or the policy Declarations.

C. Premium Computation

1. Basic Limits

There is no premium adjustment.

2. Increased Limits

Refer to state company rates/ISO loss costs for an additional charge.

D. Endorsement

Use Limited Fungi, Wet Or Dry Rot, Or Bacteria Coverage Endorsement **DP 04 22.**

Notice to Manualholders

PERSONAL LINES
DWELLING POLICY PROGRAM MANUAL – NORTH CAROLINA RULES
NOTICE DP-NC-2017-RU-001

CAUTION

Manualholders should determine from company instructions whether a company has adopted this revision.

INSTRUCTIONS TO MANUALHOLDERS

If your company has adopted this revision, you should update your manual accordingly.

EFFECTIVE DATE

The revision is subject to the following rule of application:

These changes are applicable to all new and renewal policies becoming effective on or after January 1, 2017.

CHANGE(S)

We are revising the following rules in the North Carolina Rate Pages:

- Rule **A3.** Windstorm Or Hail Exclusion – Territories 07, 08, 48, 49 And 52 Only to provide updated Building and Contents windstorm or hail exclusion credits for Territories 07, 08, 48, 49 and 52;
- Rule **A9.** Windstorm Mitigation Program to provide updated windstorm loss mitigation credits for Coverage **A** Dwelling and Coverage **C** Personal Property;
- Rule **301.** Base Premium Computation to provide updated rates for Nonseasonal and Seasonal Coverages for Owner-occupied and Non-owner-occupied key premiums for various territories; and
- Rule **404.** Mobile Or Trailer Homes – **DP 00 01** Only to provide factors for Fire and Extended Coverage.

In addition, we are introducing an exception to Rule **401.** in the North Carolina Exception Pages to update the Superior Construction Factors and we are revising Rule **406.** Deductibles in the North Carolina Exception Pages to:

- Revise the Dwelling Base Deductible from $250 to $500;
- Introduce new deductible factors for the $250 option;
- Revise deductible factors for the current all perils deductible options of $100, $1,000 and $2,500 and for the current Windstorm or Hail and Named Storm deductible options;
- Introduce additional optional higher all perils deductibles, for Fire and Extended Coverage, of $5,000, $7,500 and $10,000;
- Introduce, for all new and revised options for all coverages except Coverage **C** – Personal Property, deductible factors that will vary by Amount of Insurance thresholds of: up to $125,000, $125,001 to $175,000, $175,001 to $250,000, and $250,001 and above;
- Introduce, for new and revised all perils deductible options, separate deductible factors for Coverage **C** – Personal Property;
- Introduce, for Coverage **C** – Personal Property for optional higher percentage or fixed-dollar options for Windstorm or Hail, deductible factors that vary by windstorm or hail deductible; introduces additional optional higher percentage deductibles, for Extended Coverage, of 7.5% and 10% for Windstorm or Hail;

© Insurance Services Office, Inc., 2016

- Introduce additional optional higher fixed-dollar deductibles, for Extended Coverage, of $7,500 and $10,000 for Windstorm or Hail;
- Introduce additional optional higher percentage deductibles, for Extended Coverage, of 7.5% and 10% for Named Storm; and
- Introduce optional higher Named Storm fixed-dollar deductibles for certain coastal territories.

COMPANION REVISION

We are simultaneously revising our forms, which are being issued under a separate Notice.

ADDITIONAL RULE(S)

RULE A1.
SPECIAL STATE REQUIREMENTS

A. Special Provisions Endorsement DP 32 32

Use this endorsement with all Dwelling Policies.

B. Windstorm Exterior Paint And Waterproofing Exclusion Endorsement DP 32 61

Use this endorsement with **all** Dwelling Policies covering Extended Coverage in Territories 07 and 08.

C. Company Rates/State Rates

References in the manual to "state company rates" means "state rates" in North Carolina.

D. Flood, Earthquake, Mudslide, Mudflow, Landslide, Or Windstorm Or Hail Insurance Notice

North Carolina law provides that an insurer selling property insurance that does not provide coverage for the perils of flood, earthquake, mudslide, mudflow, landslide, or windstorm or hail shall provide a specific notice (a "warning" set forth in the related statute) to the policyholder as to which of the listed perils are not covered under the policy.

The required notice must be:

1. Provided upon issuance and renewal of each policy;

2. In Times New Roman 16-point font or another equivalent font; and

3. Must be included in the policy on a separate page immediately before the Declarations page.

The following warning, citing which peril is not covered, must be furnished with each new policy and upon each renewal:

"WARNING: THIS PROPERTY INSURANCE POLICY DOES NOT PROTECT YOU AGAINST LOSSES FROM [FLOODS], [EARTHQUAKES], [MUDSLIDES], [MUDFLOWS], [LANDSLIDES], [WINDSTORM OR HAIL]. YOU SHOULD CONTACT YOUR INSURANCE COMPANY OR AGENT TO DISCUSS YOUR OPTIONS FOR OBTAINING COVERAGE FOR THESE LOSSES. THIS IS NOT A COMPLETE LISTING OF ALL OF THE CAUSES OF LOSSES NOT COVERED UNDER YOUR POLICY. YOU SHOULD READ YOUR ENTIRE POLICY TO UNDERSTAND WHAT IS COVERED AND WHAT IS NOT COVERED."

E. North Carolina Endorsement DP 32 46

Use this endorsement with all Dwelling Policies.

RULE A2.
RESTRICTION OF INDIVIDUAL POLICIES

If a Dwelling Policy would not be issued because of unusual circumstances or exposures, the named insured may request a restriction of the policy provided no reduction in premium is allowed. Such request shall be referred to the company.

RULE A3.
WINDSTORM OR HAIL EXCLUSION – TERRITORIES 07, 08, 48, 49 AND 52 ONLY

A. Introduction

The peril of Windstorm or Hail may be excluded if:

1. The property is located in an area eligible for such coverage from the North Carolina Insurance Underwriting Association; and

2. A Windstorm or Hail Rejection Form is secured and maintained by the company.

B. Premium Computation

1. To compute the Extended Coverage Non-seasonal or Seasonal Base Premium or the Broad or Special Form Non-seasonal Base Premium:

(a) Determine the Extended Coverage, Broad or Special Form Key Premium as described in Rule **301.**

(b) Subtract the Windstorm Or Hail Exclusion Credit shown on the state rates from the Extended Coverage, Broad or Special Form Key Premium.

(c) Multiply the Extended Coverage, Broad or Special Form Key Premium excluding Windstorm or Hail Coverage developed in Paragraph **(b)** by the Key Factor for the desired limit of liability.

2. To compute the Seasonal Broad or Special Form Base Premium:

(a) Determine the **DP 00 01** Extended Coverage Key Premium as described in Rule **301.**

(b) Multiply the **DP 00 01** Extended Coverage Key Premium by the appropriate Seasonal factor shown in Table **301.A.#26(LC)** or Table **301.A.#29(LC)** to determine the Seasonal Broad or Special Form Key Premium.

(c) Subtract the Windstorm Or Hail Exclusion Base Credit shown on the state rates from the Seasonal Broad or Special Form Key Premium determined in Paragraph **(b).**

(d) Multiply the Seasonal Broad or Special Form Key Premium excluding Windstorm Or Hail Coverage developed in Paragraph **(c)** by the Key Factor for the desired limit of liability.

Copyright, North Carolina Rate Bureau, 2013
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE A3.
WINDSTORM OR HAIL EXCLUSION – TERRITORIES 07, 08, 48, 49 AND 52 ONLY (Cont'd)

C. Endorsement

Use Windstorm Or Hail Exclusion – North Carolina Endorsement **DP 32 87.**

When Windstorm Or Hail Exclusion Endorsement **DP 32 87** is attached to the policy, enter the following in Declarations:

"This policy does not provide coverage for the peril of Windstorm or Hail."

RULE A4.
REPLACEMENT COST COVERAGE – DP 00 01 ONLY

A. The policy may be endorsed to provide replacement cost coverage on buildings without deduction for depreciation.

B. This rule is intended to have limited application. Use it **only** on those **DP 00 01** policies that currently use it. Do **not** use it on any new policies.

Use Replacement Cost Endorsement **DP 32 62.**

RULE A5.
INSTALLMENT PAYMENT PLAN

When an annual policy is issued on an installment basis, the following rules apply:

A. The first installment shall be due on the effective date of the policy and the due date of the last installment shall be no later than one month prior to the policy anniversary date.

B. The premium calculated for the first installment payment, exclusive of installment charges, shall not be less than the pro rata charge for the period from the inception date of the policy to the due date of the next installment.

C. Refer to the state rates for the additional charge that shall be made for each installment.

RULE A6.
UNPROTECTED DWELLINGS – PROTECTION CLASS 9, 9E, 9S OR 10

A. Unprotected Dwellings

Unprotected dwellings are dwellings located in areas:

1. With no fire protection, in which case, Class 10 premiums apply; or

2. Designated as protection Class 9, 9E, 9S or 10, in which case, the premiums shown for these classifications apply.

B. Seasonal Dwelling

1. When the heating, plumbing and telephone facilities are suspended during the period of seasonal unoccupancy, attach Seasonal Dwelling Endorsement **DP 32 47** to the policy.

2. To determine the premium, multiply the premium developed in Paragraph **A.** by a factor of 1.10.

C. Vacancy Period Extension

The policy provides coverage for a vacant dwelling only if the period of vacancy does not exceed 60 consecutive days. This period may be extended by use of one of the two following options:

1. Vacancy And/Or Unoccupancy Permit – Unprotected Dwellings Endorsement **DP 32 52**

The additional premium for this option shall be the lower of the following calculations:

a. Multiply the limits of liability shown in the policy for Coverages **A, B** and **C** and for other coverages by the rate displayed on the state rates Table **A6.C.1.a.(R).**

b. Multiply the policy premium for all perils and coverages by a factor of .10 for each additional 30 consecutive day period (or fraction thereof) of vacancy.

2. Two Thirds Vacancy Clause – Unprotected Dwellings North Carolina Endorsement **DP 32 53**

There is no additional premium for this option, but, during the additional period of vacancy, policy limits are reduced by 33 1/3%.

D. Unoccupancy Period Extension

The policy provides coverage for an unoccupied dwelling only if the period of unoccupancy does not exceed 90 consecutive days. This period may be extended – at no additional charge – for successive periods of up to:

1. 90 consecutive days each, for non-seasonal dwellings, or

2. 10 months each, for seasonal dwellings.

Use Vacancy And/Or Unoccupancy Permit – Unprotected Dwellings Endorsement **DP 32 52.**

Copyright, North Carolina Rate Bureau, 2012 PLC
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE A7.
PRIMARY INSURANCE NOTICE

A. Endorsement

Coverage	DP 00 01	DP 00 02 And DP 00 03
A	DP 32 80	DP 32 83
B	DP 32 81	DP 32 84
C	DP 32 82	DP 32 85

Table A7.A. Primary Insurance Notice

Use the appropriate Primary Insurance Endorsement(s), specified in Table **A7.A.,** only with a North Carolina Joint Underwriting Association (NCJUA) or North Carolina Insurance Underwriting Association (NCIUA) policy insuring a dwelling building covered under Coverage **A,** structures covered under Coverage **B** or personal property covered under Coverage **C.**

These endorsements replace the Other Insurance Condition in the policy form and make the NCJUA or NCIUA policy primary insurance for the insured property specified on the endorsement. Primary Insurance may be written for Coverages **A, B** and/or **C.** When a Primary Insurance Endorsement is not attached to the policy, the Other Insurance Condition in the policy form is unchanged.

B. Rating

1. Primary Insurance

a. When the Coverage **A, B** or **C** Limit of Liability is less than 100% of actual cash value or replacement value, divide the selected limit by the ACV or replacement value, whichever applies. The result is the "Percent of Total Value".

b. Go to the First Loss Table and select the factor that corresponds to the "Percent of Total Value" computed in Paragraph **1.a.**

c. Multiply the total value of the dwelling (actual or replacement) by the factor selected in Paragraph **1.b.**

d. Use the resulting product as the limit for computing the Coverage **A, B** or **C** premium.

2. Coverage A Example

Replacement Value of Dwelling: $6,000,000

Primary Policy – Coverage **A** Limit: $1,500,000

a. Divide Coverage **A** Limit by Replacement Value limit ($1,500,000/$6,000,000 = 25% or 25.00 Percent of Total Value).

b. Find Factor that corresponds to Percent of Total Value.

c. Multiply Replacement Value by Factor from Column **2** ($6,000,000)(.712) = $4,272,000.

d. Use resulting product to compute Coverage **A** premium. (Rate the policy as if $4,272,000 is the Coverage **A** limit to be insured.)

Note

This procedure is used to determine the appropriate exposure basis for primary insurance. It does not increase the amount of coverage available.

RULE A8.
OPTIONAL RATING CHARACTERISTICS

Companies may use the following optional rating characteristics or any combination of such optional rating characteristics and Bureau filed characteristics to determine rates, as long as applicable legal requirements are satisfied. The resulting premium shall not exceed the premium that would have been determined using the rates, rating plans, classifications, schedules, rules and standards promulgated by the Bureau, except as provided by statute. The rating factor for any combination of the following optional risk characteristics cannot exceed 1.00, unless the resulting premium does not exceed the Bureau premium.

A. Policy characteristics not otherwise recognized in this manual. Examples include: account or multi-policy credit; tiers; continuity of coverage; coverages purchased; intra-agency transfers; payment history; payment options; prior insurance; and new and renewal status.

B. Policyholder/Insured personal characteristics not otherwise recognized in this manual. Examples include: smoker/non-smoker status; credit information; loss history; loss prevention training/education; age; work status; marital status; number of years owned; household composition; and good student/education.

C. Dwelling characteristics not otherwise recognized in this manual. Examples include: gated community; retirement community; limited access community; revitalized/renovated home; security, safety or loss deterrent systems or devices; age of home; and construction type and quality.

D. Affinity group or other group not otherwise recognized in this manual.

E. Any other rating characteristics or combination of characteristics if filed by a company and approved by the Commissioner.

RULE A9.
WINDSTORM MITIGATION PROGRAM

A. Introduction

With respect to risks located in Territories 07, 08, 48, 49 and 52, premium credits shall be made available for insureds who build, rebuild or retrofit certain residential dwellings, in accordance with specified standards, to better resist hurricanes and other catastrophic windstorm events.

B. Eligibility

1. A dwelling may be eligible for a premium credit if:

a. The dwelling has been designed and constructed in conformity with, and has been certified as meeting, the Hurricane, Tornado and Hail and High Wind requirements of the Hurricane Fortified for Safer Living® (Fortified) program promulgated by the Institute for Business and Home Safety® (IBHS);

b. The dwelling has been certified as meeting, either the Bronze, Silver or Gold hurricane mitigation measures in the Hurricane Fortified for Existing Homes® program promulgated by the IBHS;

c. The dwelling contains Opening Protection in accordance with the qualification requirements set forth in Paragraph **D.1.b.;** or

d. The dwelling contains a Total Hip Roof.

2. The provisions of this rule do not apply:

a. To condominiums or tenant policies.

b. If the policy excludes the peril of Windstorm or Hail.

c. To dwellings under construction.

d. To Coverage **C** – Personal Property unless the policy also provides Coverage **A** – Dwelling.

e. To mobile homes.

3. To be eligible for a premium credit, mitigation features are not required for adjacent structures including, but not limited to, detached garages, storage sheds, barns, apartments, etc. located on the insured premises.

C. Proof of Compliance

The named insured must submit proof that the windstorm loss mitigation features and/or construction techniques have been implemented for each of the following:

1. IBHS Hurricane Fortified for Safer Living®

The named insured shall provide a copy of the proper designation certificate from the IBHS issued for the dwelling.

2. IBHS Hurricane Fortified for Existing Homes®

The named insured shall provide a copy of the proper designation certificate from the IBHS issued for the dwelling. The credit will apply for five years from the date of designation. In order to continue receiving the mitigation credit after five years, the dwelling must be re-inspected and re-designated by the IBHS. If the IBHS designation expires, the applicable mitigation credit will expire upon renewal.

3. Opening Protection

The existence of Opening Protection may be verified by proof of installation.

4. Total Hip Roof

The existence of a hip roof may be verified through photographs of the roof.

D. Description of Mitigation Credit Tables

With respect to dwellings to which this rule applies and subject to all other provisions of this Windstorm Mitigation Program, the following approved and properly maintained windstorm mitigation features shall be recognized for a premium credit.

Copyright, North Carolina Rate Bureau, 2012
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE A9.
WINDSTORM MITIGATION PROGRAM (Cont'd)

1. Mitigation Features

a. IBHS Hurricane Fortified Homes

(1) A home designated by the IBHS as Hurricane Fortified for Safer Living®.

(2) A home designated by the IBHS as Hurricane Fortified for Existing Homes®, including:

(i) Hurricane Fortified for Existing Homes Bronze, Option 1

(ii) Hurricane Fortified for Existing Homes Bronze, Option 2

(iii) Hurricane Fortified for Existing Homes Silver, Option 1

(iv) Hurricane Fortified for Existing Homes Silver, Option 2

(v) Hurricane Fortified for Existing Homes Gold, Option 1

(vi) Hurricane Fortified for Existing Homes Gold, Option 2

b. Opening Protection

(1) Building opening protective features must have been tested and/or certified as having met standards of the American Society for Testing and Materials ASTM E 1886 (standard test method) and ASTM E 1996 (standard specification). Such opening protective features shall be considered qualified.

(2) Qualifying opening protection must be present at all exterior envelope openings (such as windows, garage doors, sliding doors, swinging doors, glass block, door sidelights, and skylights) on the dwelling structure. For the credit to apply, the following conditions must be met:

(i) In accordance with the qualification requirements set forth in Paragraph **D.1.b.(1):**

(a) All exterior building envelope openings with glazing (e.g. glass) shall have qualified impact-resistant and wind pressure-resistant opening protection;

(b) All exterior building envelope openings without glazing shall have qualified wind pressure-resistant opening protection; and

(c) All garage doors (with and without glazing) shall meet or exceed a qualified minimum pressure resistance.

(ii) Opening protection must be installed by a qualified contractor, according to the manufacturer's specifications.

(iii) Impact-resistant protective devices must not be made of wood structural panels, such as OSB or plywood, or be homemade.

c. Total Hip Roof

A Total Hip Roof is a roof that slopes in four directions such that the end formed by the intersection of slopes is a triangle.

E. Premium Determination

1. To compute the Extended Coverage Non-seasonal or Seasonal Base Premium or the Broad or Special Form Non-seasonal Base Premium:

a. Determine the Extended Coverage, Broad or Special Form Key Premium as described in Rule **301.**

b. Subtract the Coverage **A** Windstorm Loss Mitigation Credit shown on the state rates from the Coverage **A** Extended Coverage, Broad or Special Form Key Premium. If applicable, also subtract the Coverage **C** Windstorm Loss Mitigation Credit, shown on the state rates from the Coverage **C** Extended Coverage, Broad or Special Form Key Premium.

c. Multiply the Extended Coverage, Broad or Special Form Key Premium excluding Windstorm Loss Mitigation Coverage developed in Paragraph **1.b.** by the Key Factor for the desired limit of liability.

2. To compute the Seasonal Broad or Special Form Base Premium:

a. Determine the **DP 00 01** Extended Coverage Key Premium as described in Rule **301.**

b. Multiply the **DP 00 01** Extended Coverage Key Premium by the appropriate Seasonal factor shown in Table **301.A.#26(LC)** or Table **301.A.#29(LC)** to determine the Seasonal Broad or Special Form Key Premium.

c. Subtract the Coverage **A** Windstorm Loss Mitigation Credit shown in the state rates from the Coverage **A** Seasonal Broad or Special Form Key Premium determined in Paragraph **2.b.** If applicable, also subtract the Coverage **C** Windstorm Loss Mitigation Credit, shown on the state rates from the Coverage **C** Seasonal Broad or Special Form Key Premium.

d. Multiply the Seasonal Broad or Special Form Key Premium excluding Windstorm Loss Mitigation Coverage developed in Paragraph **2.c.** by the Key Factor for the desired limit of liability.

3. Mitigation Feature credits cannot be combined, except for Total Hip Roof and Opening Protection.

4. If mitigation measures are installed midterm, premium adjustment is required on a pro rata basis.

PART I
COVERAGE AND DEFINITION TYPE RULES

RULE 100.
INTRODUCTION

Paragraph **C.** does not apply.

RULE 103.
ELIGIBILITY

Paragraph **B.4.** is replaced by the following:

4. For a policy period of not longer than three years; and

RULE 104.
PROTECTION CLASSIFICATION INFORMATION

Rule **104.** is replaced by the following:

Determine the ISO Public Protection classification; refer to ISO's Community Mitigation Classifications (CMC) Manual, applicable to the municipality or classified area where the insured property is located.

PART II
SERVICING TYPE RULES

RULE 201.
POLICY PERIOD

Paragraph **C.** is replaced by the following:

C. Three years in annual installments. Each annual installment shall be the annual premium then in effect for the company.

RULE 206.
MINIMUM PREMIUM

Paragraphs **D.** and **E.** are replaced by the following:

D. Refer to state company rates for the minimum premium.

RULE 208.
WAIVER OF PREMIUM

Paragraph **B.** is replaced by the following:

B. Refer to state company rates for amount that may be waived.

PART III
BASE PREMIUM COMPUTATION RULES

RULE 302.
VANDALISM AND MALICIOUS MISCHIEF – DP 00 01

The following is added to Rule **302.:**

The 60 day limit of vacancy may be extended. The charge for the additional period of vacancy shall be based on the difference between the premiums for vacant and non-vacant buildings, and shall be figured pro rata for the period allowed in the endorsement.

Use Vandalism And Malicious Mischief Vacancy Endorsement **DP 04 40.**

RULE 305.
LOSS SETTLEMENT OPTIONS

Paragraph **A.4.** is replaced by the following:

A. Functional Replacement Cost Loss Settlement – Forms DP 00 02 And DP 00 03 Only

4. Endorsement

Use Functional Replacement Cost Loss Settlement – North Carolina Endorsement **DP 32 63.**

Paragraph **B.** is replaced by the following:

B. Actual Cash Value Loss Settlement – Forms DP 00 02 And DP 00 03 Only

1. Introduction

The policy provides building loss settlement on a replacement cost basis if, at the time of loss, the amount of insurance on the damaged building represents at least 80% of the full replacement cost of the building immediately before the loss.

2. Coverage Description

The policy may be endorsed to provide building loss settlement exclusively on an actual cash value basis if, on the inception date of the policy, the Coverage **A** limit of liability selected by the insured is less than 80% of the full replacement cost of the dwelling.

3. Mobile Or Trailer Home

When written in conjunction with this endorsement, Form **DP 00 02** may be used to insure a mobile or trailer home.

To develop the Base Premium, multiply the premium developed in Rule **301.** by a factor of .98.

Copyright, North Carolina Rate Bureau, 2014
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE 305.
LOSS SETTLEMENT OPTIONS (Cont'd)

4. Dwelling Building Other Than Mobile Or Trailer Home

The premium is computed as follows:

a. Multiply the Coverage **A** limit of liability by the appropriate factor from the following table and round to the nearest $1,000:

% Of Replacement Value*	Factor
20%	4.00
30%	2.67
40%	2.00
50%	1.60
60%	1.33
70%	1.14

Table 305.B.4.a. Factors

b. Develop a Base Premium in accordance with Rule **301.** for the amount of insurance computed in Paragraph **B.4.a.**

c. Multiply the premium determined in Paragraph **B.4.b.** by the appropriate factor from the following table:

% Of Replacement Value*	Factor
20%	.73
30%	.74
40%	.75
50%	.76
60%	.77
70%	.78
80%	.80

Table 305.B.4.c. Factors

5. Endorsement

Use Actual Cash Value Loss Settlement Endorsement **DP 04 76.**

PART IV
ADJUSTED BASE PREMIUM COMPUTATION RULES

RULE 401.
SUPERIOR CONSTRUCTION

Table **401.C.** is replaced by the following:

Classifications	Fire	E.C., Broad & Special Forms
Fire Resistive & Masonry Non-combustible	.50	.75
Non-combustible	.50	1.00

Table 401.C. Superior Construction Factors

RULE 406.
DEDUCTIBLES

Rule **406.** is replaced by the following:

All policies are subject to a deductible that applies to loss from all perils, except Earthquake. A separate deductible type applies to Earthquake Coverage as described in Rule **509.**

Refer to the Earthquake Coverage rule for the applicable deductible provision.

A. Base Deductible

$500 Deductible

B. Optional Deductibles

1. All Perils Deductibles

To compute the premium for these options, multiply the Base Premium for the Base Deductible by the factors selected from the following tables:

Fire				
Coverage A, B, D Or E And Coverage Options For Buildings And Non-building Structures				
	Coverages A, B, D And E Limit (Expressed In $)			
Deductibles	**Up To 125,000**	**125,001 To 175,000**	**175,001 To 250,000**	**250,001 And Above**
$ 100*	1.080	1.070	1.060	1.050

RULE 406.
DEDUCTIBLES (Cont'd)

2. Windstorm Or Hail Deductibles

When the policy covers the peril of Windstorm or Hail, the following deductible options may be used in conjunction with a deductible applicable to all other perils covered under Extended Coverage, Broad or Special Forms. They may not be used on a policy in conjunction with a Named Storm deductible as described in Paragraph **3.**

a. Percentage Deductibles

(1) Deductible Amounts

This option provides for higher Windstorm or Hail percentage deductibles of 1%, 2%, 5%, 7.5% and 10% of the limit of liability that applies to Coverage **A, B, D** or **E,** whichever is greatest, when the dollar amount of the percentage deductible selected exceeds the amount of the All Other Perils deductible. This option is not available for policies covering only personal property.

(2) Endorsement

Use Windstorm Or Hail Percentage Deductible Endorsement **DP 03 12.**

(3) Declarations Instructions

Enter, on the policy Declarations, the percentage amount that applies to Windstorm or Hail and the dollar amount that applies to All Other Perils. For example:

Deductible – Windstorm or Hail 2% of the Coverage **A** limit and $500 for All Other Perils.

(4) Deductible Application

In the event of a Windstorm or Hail loss to covered property, the dollar amount is deducted from the total of the loss for all coverages.

(5) Coverage Options

The deductible factors for Coverage **A, B, D** or **E** and Coverage Options For Buildings And Non-building Structures differ by the deductible percentage amounts that apply to Windstorm or Hail, deductible amounts that apply to other perils, and the Coverage **A, B, D** or **E** limit.

The deductible factors for Coverage **C** and Other Personal Property Coverage Options differ by the deductible percentage amounts that apply to Windstorm or Hail and the deductible amounts that apply to other perils.

(6) Use Of Factors

The factors for the Windstorm or Hail Deductibles incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Windstorm or Hail deductible.

(7) Deductible Factors

When the property is located in an area serviced by the North Carolina Insurance Underwriting Association (NCIUA – Territories 07, 08, 48, 49 and 52), additional calculations must be performed to ensure that the premium credit applied to the deductible is **not** greater than the premium credit that would be applied if the peril of Windstorm or Hail were excluded from the policy.

Copyright, North Carolina Rate Bureau, 2016 **PLC**
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE 406.
DEDUCTIBLES (Cont'd)

(a) Property **Not** Located in Area Serviced by the NCIUA

To compute the premium for this provision, multiply the Extended Coverage, Broad or Special Form Base Premium for the Base Deductible for each coverage insured under the policy by the factor selected for the desired windstorm or hail deductible options from the following tables.

(b) Property **Is** Located in Area Serviced by the NCIUA

To determine if an "adjusted deductible credit" or the calculated deductible credit applies, complete each of the following steps:

Step **1.** Multiply the windstorm or hail exclusion credit shown in the state rates, under Additional Rule **A3.** Windstorm Or Hail Exclusion – Territories 07, 08, 48, 49 And 52 Only, by the Key Factor, for the same amount of insurance used to determine the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** Multiply the result determined in Step **1.** by .9 to determine the "adjusted deductible credit".

Step **3.** Select the factor for the desired windstorm or hail deductible option from the following tables and subtract the factor from unity (1.00).

Step **4.** Multiply the factor determined in Step **3.** by the Extended Coverage, Broad or Special Form Base Premium. The result is the windstorm or hail deductible credit.

Step **5.** Compare the results in Steps **2.** and **4.** If the result in:

Step **2.** is **less than** the result in Step **4.,** to compute the premium, subtract the "adjusted deductible credit" from the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** is **greater than or equal to** Step **4.,** multiply the Extended Coverage, Broad or Special Form Base Premium by the factor for the desired windstorm or hail deductible option.

Table 406.B.2.a.(7)#4 Coverage C And Other Personal Property Windstorm Or Hail Percentage Deductibles

b. Higher Fixed-Dollar Deductibles

(1) Deductible Amounts

This option provides for higher Windstorm or Hail fixed-dollar deductible amounts of $1,000, $2,000, $5,000, $7,500 and $10,000 when the dollar amount of the higher fixed-dollar deductible selected exceeds the amount of the All Other Perils deductible. This option is not available for policies covering only personal property.

(2) Endorsement

An endorsement is not required.

(3) Declarations Instructions

Separately enter, on the policy Declarations, the deductible amounts that apply to Windstorm or Hail and All Other Perils. For example: $1,000 for Windstorm or Hail and $500 for All Other Perils.

(4) Deductible Application

In the event of a Windstorm or Hail loss to covered property, the dollar amount is deducted from the total of the loss for all coverages.

(5) Coverage Options

The deductible factors for Coverage **A, B, D** or **E** and Coverage Options For Buildings And Non-building Structures differ by the deductible amounts that apply to Windstorm or Hail and to other perils and the Coverage **A, B, D** or **E** limit.

The deductible factors for Coverage **C** and Other Personal Property Coverage Options differ by the deductible amounts that apply to Windstorm or Hail and other perils.

(6) Use Of Factors

The factors for the Windstorm or Hail Deductibles incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Windstorm or Hail deductible.

(7) Deductible Factors

When the property is located in an area serviced by the North Carolina Insurance Underwriting Association (NCIUA – Territories 07, 08, 48, 49 and 52), additional calculations must be performed to ensure that the premium credit applied to the deductible is **not** greater than the premium credit that would be applied if the peril of Windstorm or Hail were excluded from the policy.

Insurance Services Office, Inc., with its permission.

RULE 406.
DEDUCTIBLES (Cont'd)

(a) Property **Not** Located in Area Serviced by the NCIUA

Multiply the Extended Coverage, Broad or Special Form Base Premium for the Base Deductible for each coverage insured under the policy by the factor selected for the desired windstorm or hail deductible options from the following tables.

(b) Property **Is** Located in Area Serviced by the NCIUA

To determine if an "adjusted deductible credit" or the calculated deductible credit applies, complete each of the following steps:

Step **1.** Multiply the windstorm or hail exclusion credit shown in the state rates under Additional Rule **A3.** Windstorm Or Hail Exclusion – Territories 07, 08, 48, 49 And 52 Only, by the Key Factor, for the same amount of insurance used to determine the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** Multiply the result determined in Step **1.** by .9 to determine the "adjusted deductible credit".

Step **3.** Select the factor for the desired windstorm or hail deductible option from the following tables and subtract the factor from unity (1.00).

Step **4.** Multiply the factor determined in Step **3.** by the Extended Coverage, Broad or Special Form Base Premium. The result is the windstorm or hail deductible credit.

Step **5.** Compare the results in Steps **2.** and **4.** If the result in:

Step **2.** is **less than** the result in Step **4.,** to compute the premium, subtract the "adjusted deductible credit" from the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** is **greater than or equal to** Step **4.,** multiply the Extended Coverage, Broad or Special Form Base Premium by the factor for the desired windstorm or hail deductible option.

RULE 406.
DEDUCTIBLES (Cont'd)

3. Named Storm Deductibles – Territories 07, 08, 48, 49 and 52

When the policy covers the peril of Windstorm or Hail, the following deductible options may be used in the listed territories in conjunction with the deductible applicable to all other Perils under Extended Coverage, Broad or Special Forms. They may not be used on a policy in conjunction with a Windstorm or Hail deductible as described in Paragraph **2.**

a. Percentage Deductibles – Territories 07, 08, 48, 49 and 52 Only

(1) Deductible Amounts

This option provides for higher Named Storm percentage deductibles of 1%, 2%, 5%, 7.5% and 10% of the limit of liability that applies to Coverage **A, B, D** or **E,** whichever is greatest, when the dollar amount of the percentage deductible selected exceeds the amount of the All Other Perils deductible. This option is not available for policies covering only personal property.

(2) Endorsement

Use Named Storm Deductible – North Carolina Endorsement **DP 32 18.**

(3) Declarations Instructions

Enter, on the policy Declarations, the percentage amount that applies to Named Storm and the dollar amount that applies to All Other Section **I** Perils. For example:

Deductible – Named Storm 2% of Coverage **A** limit and $500 for all other perils.

(4) Deductible Application

In the event of a Named Storm loss to covered property, the dollar amount is deducted from the total of the loss for all coverages.

(5) Coverage Options

The deductible factors for Coverage **A, B, D** or **E** and Coverage Options For Buildings and Non-building Structures differ by the deductible percentage amounts that apply to Named Storm, deductible amounts that apply to other perils and the Coverage **A, B, D** or **E** limit.

The deductible factors for Coverage **C** and Other Personal Property Coverage Options differ by the deductible percentage amounts that apply to Named Storm and the deductible amounts that apply to other perils.

(6) Use Of Factors

The factors displayed in Paragraph **(7)** incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Named Storm deductible.

(7) Deductible Factors

When the property is located in an area serviced by the North Carolina Insurance Underwriting Association (NCIUA – Territories 07, 08, 48, 49 and 52), additional calculations must be performed to ensure that the premium credit applied for the deductible is **not** greater than the premium credit that would be applied if the peril of Windstorm or Hail were excluded from the policy.

To determine if an "adjusted deductible credit" or the calculated deductible credit applies, complete each of the following steps:

Step **1.** Multiply the windstorm or hail exclusion credit shown in the state rate pages, under Additional Rule **A3.** Windstorm Or Hail Exclusion – Territories 07, 08, 48, 49 And 52 Only, by the Key Factor, for the same amount of insurance used to determine the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** Multiply the result determined in Step **1.** by .9 to determine the "adjusted deductible credit".

Step **3.** Select the factor for the desired named storm deductible option from the following table and subtract that factor from unity (1.00).

Step **4.** Multiply the factor determined in Step **3.** by the Extended Coverage, Broad or Special Form Base Premium. The result is the named storm deductible credit.

Step **5.** Compare the results in Steps **2.** and **4.** If the result in:

Step **2.** is **less** than the result in Step **4.,** to compute the premium, subtract the "adjusted deductible credit" from the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** is **greater than or equal to** the result in Step **4.,** multiply the Extended Coverage, Broad or Special Form Base Premium by the factor for the desired named storm deductible option.

RULE 406.
DEDUCTIBLES (Cont'd)

b. Higher Fixed-dollar Deductibles – Territories 07, 08, 48, 49 And 52 Only

(1) Deductible Amounts

This option provides for higher Named Storm Fixed-dollar deductible amounts of $1,000, $2,000, $5,000, $7,500 and $10,000 when the dollar amount of the higher fixed-dollar deductible selected exceeds the amount of the All Other Perils deductible. This option is not available for policies covering only personal property.

(2) Endorsement

Use Named Storm Deductible – North Carolina Endorsement **DP 32 18.**

(3) Declarations Instructions

Enter, on the policy Declarations, the deductible amounts that apply to Named Storm and All Other Perils. For example: $1,000 for Named Storm and $500 for All Other Perils.

(4) Deductible Application

In the event of a Named Storm loss to covered property, the dollar amount is deducted from the total of the loss for all coverages.

(5) Coverage Options

The deductible factors for Coverage **A, B, D** or **E** and Coverage Options For Buildings And Non-building Structures differ by the deductible amounts that apply to Named Storm and to other perils and the Coverage **A, B, D** or **E** limit.

The deductible factors for Coverage **C** and Other Personal Property Coverage Options differ by the deductible amounts that apply to Named Storm and to other perils.

(6) Use Of Factors

The factors displayed in Paragraph **(7)** incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Named Storm deductible.

(7) Deductible Factors

When the property is located in an area serviced by the North Carolina Insurance Underwriting Association (NCIUA – Territories 07, 08, 48, 49 and 52), additional calculations must be performed to ensure that the premium credit applied for the deductible is not greater than the premium credit that would be applied if the peril of Windstorm or Hail were excluded from the policy.

To determine if an "adjusted deductible credit" or the calculated deductible credit applies, complete each of the following steps:

Step **1.** Multiply the windstorm or hail exclusion credit shown in the state rate pages, under Additional Rule **A3.** Windstorm Or Hail Exclusion – Territories 07, 08, 48, 49 And 52 Only, by the Key Factor, for the same amount of insurance used to determine the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** Multiply the result determined in Step **1.** by .9 to determine the "adjusted deductible credit".

Step **3.** Select the factor for the desired named storm deductible option from the following table and subtract that factor from unity (1.00).

Step **4.** Multiply the factor determined in Step **3.** by the Extended Coverage, Broad or Special Form Base Premium. The result is the named storm deductible credit.

Step **5.** Compare the results in Steps **2.** and **4.** If the result in:

Step **2.** is **less** than the result in Step **4.,** to compute the premium, subtract the "adjusted deductible credit" from the Extended Coverage, Broad or Special Form Base Premium.

Step **2.** is **greater than or equal to** the result in Step **4.,** multiply the Extended Coverage, Broad or Special Form Base Premium by the factor for the desired named storm deductible option.

RULE 407.
AUTOMATIC INCREASE IN INSURANCE

Rule **407.** is replaced by the following:

A. Automatic Increase In Insurance Endorsement – DP 32 11

1. The policy may be endorsed to provide automatic annual increases in the Coverage **A, B** and **C** limits of liability. Apply a factor to the Base Premium as follows:

Amount Of Annual Increase	Factor
4%	1.02
6%	1.03
8%	1.04
Each Additional 4% over 8% add:	.02

Table 407.A.1. Factors

2. The premium for a 3 year policy is 3.2 times the annual policy premium.

3. Use Automatic Increase In Insurance Endorsement **DP 32 11.**

B. Inflation Guard Endorsement – DP 32 70

1. The policy may be extended to automatically adjust the limit of liability applicable to Coverage **A** under the Dwelling Policy. This limit will be adjusted at the same rate as the change in the Index shown on the Declarations, billing notice or named on the form.

2. There is no additional charge for this endorsement. Companies electing to use this endorsement must use it exclusively and are required to notify the North Carolina Rate Bureau of their election.

3. The following Indexes have been approved by the Department of Insurance and may be used with the approved Inflation Guard Endorsement:

(a) Marshall & Swift Boeckh (MS/B) Residential Cost Index published by the American Appraisal Company, Inc.;

(b) Composite Construction Cost Index published by the U.S. Department of Commerce;

(c) Consumer Price Index published by the U.S. Department of Labor;

(d) Marshall & Swift Boeckh (MS/B) Construction Cost Index published Marshall & Swift Boeckh (MS/B);

(e) RSMeans CostWorks Valuator published by RSMeans.

(f) Xactware Inflation Index published by Xactware Solutions, Inc.

4. Use Inflation Guard Endorsement **DP 32 70.**

RULE 408.
ALARMS, SMOKE DETECTORS, FIRE EXTINGUISHERS AND AUTOMATIC SPRINKLERS

The title of Rule **408.** Protective Devices is replaced by the preceding title.

Rule **408.** is replaced by the following:

A. Approved and properly maintained installations of fire alarms, smoke detectors, automatic sprinklers and fire extinguishers in the dwelling may be recognized for a reduced premium – computed by multiplying the fire Base Premium by the selected factors as follows.

Type Of Installation*	Dwelling Factor	Mobile Or Trailer Home Factor
Central Station Reporting Fire Alarm	.90	.92
Fire Department Reporting Fire Alarm	.93	.95
Local Fire Alarm Smoke Detectors	.95	.97
Automatic Sprinklers in all areas including attics, bathrooms, closets, attached structures	.80	.90
Automatic Sprinklers in all areas except attic, bathroom, closet and attached structure areas that are protected by a fire detector	.90	.95
Fire Extinguishers	.95	.95
* Refer to Company for eligibility, types of systems and devices, installation, and available credits.		

Table 408.A. Protective Devices Factors

B. A premium credit for Fire Extinguishers shall be allowed if the dwelling has, installed on each floor and basement in a readily accessible place, at least:

1. One fire extinguisher classified and labeled as 2-A (classified as A-1 prior to July 1, 1956), or

2. Two fire extinguishers classified and labeled as 1-A (classified as A-2 prior to July, 1956).

The extinguishers must be maintained in good, working order.

C. Use Premises Alarm Or Fire Protection System Endorsement **DP 32 50.**

Copyright, North Carolina Rate Bureau, 2014
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE 409.
ACTUAL CASH VALUE LOSS SETTLEMENT WINDSTORM OR HAIL LOSSES TO ROOF SURFACING – DP 00 02, DP 00 03 AND DP 00 01 WITH DP 00 08

Rule **409.** does not apply.

RULE 410.
BUILDING CODE EFFECTIVENESS GRADING

Rule **410.** does not apply.

PART V
ADDITIONAL COVERAGES AND INCREASED LIMITS RULES

RULE 502.
COVERAGE D – FAIR RENTAL VALUE COVERAGE E – ADDITIONAL LIVING EXPENSE

Paragraph **A.** is replaced by the following:

A. Introduction

Coverage is provided in the forms on a limited basis as follows:

1. Form DP 00 01

a. Coverage D

Up to 10% of the Coverage **A** limit is available. Use of this option reduces the Coverage **A** limit for the same loss.

b. Coverage E

Not automatically included in form. It may be added as noted in Paragraph **B.**

2. Form DP 00 02 Or DP 00 03

Coverage **D** and **E** combined – Up to 10% of the Coverage **A** limit is available for Coverage **D** and Coverage **E** combined as additional insurance.

RULE 507.
FIRE DEPARTMENT SERVICE CHARGE

Rule **507.** is replaced by the following:

The limit of $500 provided under the policy may be increased. Refer to the state rates.

RULE 509.
EARTHQUAKE COVERAGE

Rule **509.** is replaced by the following:

A. Coverage Description

When added to the Fire policy, this peril shall apply to the same coverages and for the same limits that apply to the peril of Fire.

Use Earthquake Coverage Endorsement **DP 04 69.**

B. Loss Assessment Coverage

When the policy is extended to cover loss assessment resulting from loss by this peril, the limit of liability shall be based on the insured's proportionate interest in total value of all collectively owned buildings and structures of the corporation or association of property owners. Refer to company for rates.

Use Loss Assessment Coverage For Earthquake Endorsement **DP 04 68.**

C. Deductible

The base deductible is 5% of the limit of liability for Coverage **A, B** or **C,** whichever is greatest and is subject to a $250 minimum.

This deductible may be increased for a premium credit. In the event of an Earthquake loss to covered property, the dollar amount is deducted from the total of the loss for Coverages **A, B** and **C.**

D. Premium For Base Deductible

Develop the premium as follows:

1. From the state rates:

a. Determine the Earthquake Zone;

b. Determine if Rate Table **A,** and/or **B** applies;

c. Select the rate according to construction from the Rate Table; and

2. Multiply the rate determined in Paragraph **D.1.c.** by the amounts of insurance for:

a. Coverages **A, B, C, D** and **E;**

b. Improvements, Alterations and Additions – Increased Limits;

c. Other Building Coverage options (i.e. Bldg. Items Coverage);

d. Other Personal Property Coverage (i.e. Merchandise in Storage);

e. Ordinance or Law total amount of insurance (includes basic, and if applicable, increased amounts).

E. Premium for Higher Deductibles

Multiply the Base Premium determined in Paragraph **E.** by a factor from the following table:

Deductible Percentage	Frame And Superior	Masonry
10%	.89	.95
15%	.78	.89
20%	.67	.84
25%	.56	.79

Table 509.E. Higher Deductibles Factors

RULE 510.
THEFT COVERAGE

This rule is deleted.

Refer to the Theft Insurance program filed by or on behalf of the company insuring the risk.

Copyright, North Carolina Rate Bureau, 2014
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE 512.
WINDSTORM OR HAIL COVERAGE – MISCELLANEOUS PROPERTIES

The title of Rule **512.** Windstorm Or Hail Coverage - Awnings, Signs And Outdoor Radio And Television Equipment is replaced by the preceding title.

Rule **512.** is replaced by the following:

A. Property Not Covered

The peril of Windstorm or Hail does **not** cover damage to the following properties whether attached to or separated from a dwelling or other structure on the Described Location:

1. Signs or cloth awnings, including their supports;

2. Radio or television antennas or aerials, including their lead-in wiring, masts or towers;

3. Swimming pools;

4. Screens, including their supports, around a swimming pool, patio or other areas;

5. Fences, property line and similar walls, including seawalls;

6. Bathhouses, cabanas, greenhouses, hothouses, pergolas, slathouses, trellises;

7. Outdoor equipment used to service the Described Location; or

8. Structures located over water, whether or not permanently attached to the ground, including the property in or on the structure.

B. Endorsement

Damage to these properties may be covered for an additional premium. Separately describe each property item and corresponding limit of liability on Windstorm Or Hail – Miscellaneous Properties Endorsement **DP 32 19** or the Declarations.

C. Greenhouses And/Or Hothouses

1. When the structure, greenhouse (hothouse) glass and any flowers and plants contained in the structure are insured as a single item:

a. Include, in the limit of liability for each structure, the value of all glass, as computed in Paragraph **1.c.,** and the value of any flowers and plants in that structure;

b. Add the "Glass Condition of Insurance", in Paragraph **3.a.** of this rule, to Windstorm Or Hail – Miscellaneous Properties Endorsement **DP 32 19** or the Declarations; and

c. Specify, in the "Glass Condition of Insurance", the dollar amount of all glass being insured. This amount is determined by multiplying the agreed value per square foot of glass by the number of square feet of all insured glass.

2. When the structure, greenhouse (hothouse) glass or the flowers and plants contained in the structure are **separately** insured, specify the limit of liability **separately** for each structure, all glass and the flowers and plants in that structure.

When glass is separately insured:

a. Add the "Glass Condition of Insurance", in Paragraph **3.b.** of this rule, to Windstorm Or Hail – Miscellaneous Properties Endorsement **DP 32 19** or the Declarations; and

b. Specify, in the "Glass Condition of Insurance", the agreed value per square foot of glass and the number of square feet of all glass. The limit of liability of all glass being insured is determined by multiplying these two amounts.

3. Glass Condition of Insurance

a. Use this Condition when glass is **not** separately insured:

"Windstorm or Hail Coverage for Greenhouse (Hothouse) Glass

It is understood by you and us that, in the event greenhouse (hothouse) glass is broken or destroyed by the peril of Windstorm or Hail, we will pay no more than the least of the following amounts:

A. $____. This dollar amount for greenhouse (hothouse) glass is determined by multiplying:

1. The agreed value per square foot of greenhouse (hothouse) glass, $____, by

2. The number of square feet of all insured greenhouse (hothouse) glass, ____;

B. An amount computed by:

1. Dividing the number of square feet of all broken or destroyed greenhouse (hothouse) glass by the total number of square feet of insured greenhouse (hothouse) glass, and

2. Multiplying the amount computed in **B.1.** above by the dollar amount for greenhouse (hothouse) glass stated in **A.** above; or

C. The actual cost to repair or replace the broken or destroyed greenhouse (hothouse) glass.

Also, if greenhouse (hothouse) glass is covered by other insurance, we will pay no more than the proportion of a loss that the dollar amount for such greenhouse (hothouse) glass stated in **A.** above bears to the total amount of insurance covering that glass".

Copyright, North Carolina Rate Bureau, 2008 **PLC**
Includes copyrighted material of
Insurance Services Office, Inc., with its permission.

RULE 512.
WINDSTORM OR HAIL COVERAGE – MISCELLANEOUS PROPERTIES (Cont'd)

b. Use this Condition when glass **is** separately insured:

"Windstorm or Hail Coverage for Greenhouse (Hothouse) Glass

It is understood by you and us that, in the event greenhouse (hothouse) glass is broken or destroyed by the peril of Windstorm or Hail, we will pay no more than the least of the following amounts:

A. The limit of liability declared above for greenhouse (hothouse) glass, which is determined by multiplying:

1. The agreed value per square foot of greenhouse (hothouse) glass, $ ____, by

2. The number of square feet of all insured greenhouse (hothouse) glass, ____;

B. An amount computed by:

1. Dividing the number of square feet of all broken or destroyed greenhouse (hothouse) glass by the total number of square feet of insured greenhouse (hothouse) glass, and

2. Multiplying the amount computed in **B.1.** above by the limit of liability for greenhouse (hothouse) glass declared above; or

C. The actual cost to repair or replace the broken or destroyed greenhouse (hothouse) glass.

Also, if greenhouse (hothouse) glass is covered by other insurance, we will pay no more than the proportion of loss that our limit of liability for such greenhouse (hothouse) glass bears to the total amount of insurance covering that glass".

D. Premium

Refer to the state rates.

RULE 513.

PREFILED TESTIMONY
OF
ROBERT J. CURRY

2016 DWELLING INSURANCE
FILING BY THE
NORTH CAROLINA RATE BUREAU

Q. Please state your name and business address.

A. My name is Robert J. Curry. My business address is Insurance Services Office, 545 Washington Boulevard, Jersey City, New Jersey.

Q. By whom are you employed?

A. I am employed by Insurance Services Office (ISO) and have been employed by ISO since October 8, 1984.

Q. What are your responsibilities at ISO?

A. At the time when this rate review was prepared I was generally responsible for managing and overseeing the operations of the Personal Property Actuarial Division at ISO. The Personal Property Actuarial Division is responsible for ISO's total ratemaking operation as it pertains to personal property insurance, including homeowners, dwelling and inland marine coverages. We are generally responsible for doing analyses that pertain to ratemaking for the personal property coverages including reviewing experience, making filings, analysis of classification plans, etc. ISO is involved in ratemaking for the personal property coverages in general in all of the 50 states plus the District of Columbia and Puerto Rico.

Q. What is your employment background?

A. I have been employed by ISO for over thirty years in various actuarial positions. I was hired as an Actuarial Assistant in 1984 in the Data Management and Control area. In 1990, I joined Actuarial Development as an Actuarial Consultant coordinating work on the quarterly Industry Operating Results and several Insurance Issues Series studies. In 1994, I joined Actuarial Government Services as a Regional Actuary.

In 1998, I joined the Personal Lines Actuarial Division (PLAD) as a Manager and Associate Actuary. In PLAD, I was responsible for personal auto filings in 25 states and the use of catastrophe models in personal property ratemaking. In 2003 I was appointed Assistant Vice President and Actuary of the Personal Property Actuarial Division. In 2015, after reorganization I was named Actuarial Product Director for Personal Property and I am now Vice President - Market Development.

Q. What is your background in actuarial science and your educational background?

A. I have a Bachelor of Science degree in mathematics from Cook College at Rutgers University. I am a Fellow of the Casualty Actuarial Society (CAS) and a member of the American Academy of Actuaries (AAA). I have met the continuing professional education requirements of the AAA through the date of this testimony. I am a Chartered Property Casualty Underwriter (CPCU). I have also earned the Associate in Insurance Accounting and Finance (AIAF) and Associate in Regulatory Compliance (ARC) designations. I am currently a member of the CAS Ratemaking and Product Management Seminar Committee and the CAS Trust Scholarship Committee. I have served on the CAS Examination Committee, CAS Committee on Special Interest Seminars, CAS Continuing Education Committee and CAS Syllabus Committee. I was the chairman of the CAS Predictive Modeling Seminar Committee. I have also served as a member of the American Academy of Actuaries Committee on Automobile Insurance Issues. I am currently the chairman of the In Focus Seminar planning committee.

Q. Are you familiar with dwelling ratemaking in other states?

A. Yes. As part of my duties at ISO, I am familiar with the data collection and ratemaking procedures in use in all states and including North Carolina for dwelling insurance (“dwelling” insurance). At the time the review was prepared I was responsible for supervising the preparation of filings for all of the states and the District of Columbia and Puerto Rico.

Q. What work have you performed with respect to the Rate Bureau's 2016 dwelling rate filing in North Carolina?

A. Through ISO I have been involved in the preparation of the 2016 dwelling rate and territory definition filing for the Rate Bureau in two respects. First, ISO, as a licensed statistical agent in North Carolina, collects data from a significant number of insurers that write dwelling insurance in North Carolina, as well as the North Carolina Insurance Underwriting Association (commonly called the "Beach Plan") and the North Carolina Joint Underwriting Association (commonly called the "FAIR Plan") which are residual market mechanisms. The Independent Statistical Service (ISS), American Association of Insurance Services (AAIS) and the National Independent Statistical Service (NISS) are the licensed statistical organizations which collect data from the other companies.

The ratemaking experience reflected in Exhibit RB-1 is, in general, supplied by the individual insurance companies and the two residual market organizations. The data are submitted to one of the four statistical organizations (ISO, NISS, AAIS or ISS). The statistical organizations subject the data that are reported to them to a series of verification edits and then consolidate the data. The ISS, AAIS and the NISS then transmit their consolidated data to ISO for a further consolidation with the ISO data. After consolidating the data, ISO produces exhibits of the combined data in a format and detail necessary for ratemaking. As noted in the filing, certain data is excluded from various calculations.

ISO and other statistical agents collect, compile and maintain the data underlying this filing as a regular practice and in the regular course of their business responsibilities as licensed statistical agents in all states.

Second, ISO provides consulting actuarial services directly to the Rate Bureau. I have been directly

involved in this aspect of the Rate Bureau's dwelling rate filings for a number of years. As in the past, my staff and I compiled the ratemaking data to be reviewed by the Property Rating Subcommittee, the Property Committee and the Governing Committee in preparation of the filing.

Under my direction, my staff put together the vast majority of the data, information and calculations contained in Exhibit RB-1. This lengthy process was performed throughout the year 2016 under the ultimate direction of the Bureau committees.

Finally, I have reviewed the filed rates and territory definitions to determine if they are calculated in accordance with the Casualty Actuarial Society's Statement of Principles Regarding Property and Casualty Insurance Ratemaking. In accordance with Actuarial Standard of Practice No. 17 Expert Testimony by Actuaries, I conducted my review in terms of reasonableness rather than solely in terms of whether there is precise agreement on each issue. In addition, I applied the rate standards set forth in North Carolina General Statute 58-36-10, i.e., that rates must not be excessive, inadequate or unfairly discriminatory and that certain statutory rating factors must be considered.

Q. What data are utilized in Exhibit RB-1?

A. With respect to Exhibit RB-1 the supporting data for the rate level changes for dwelling insurance are contained in Section C. Five years of premium and loss experience are displayed in Section C. The five years are the years ended December 31, 2009 through December 31, 2013.

The loss experience used in the filing is what we call "accident year" experience. I can explain that best by giving you an example. The losses for the accident year ended December 31, 2013 consist of all losses caused by claims that occurred during the one-year period ended December 31, 2013. If a claim occurred December 29, 2013 and resulted in either a loss being paid or a reserve being established after January 1, 2014, that

loss would be a part of the accident year losses for the period ended December 31, 2013. The criteria for slotting losses into accident years is the date the claim occurred.

Q. Please describe what are commonly called the “Beach Plan” and the “FAIR Plan” and the role of their loss data?

A. The term “Beach Plan” is the commonly used term for the North Carolina Insurance Underwriting Association. It is a residual market organization set up by the North Carolina legislature in Article 45 of the insurance statutes. It writes dwelling, homeowners and other types of property insurance policies for policyholders in the 18 coastal counties. A residual market organization writes policies for policyholders who cannot obtain insurance in the voluntary market. Although voluntary companies have chosen not to accept the risk of writing dwelling policies at the rates that they can charge, North Carolina law requires those companies to be responsible for payment of some or all of the losses that occur on those policies when they are written by the Beach Plan.

The Beach Plan writes policies in its own name. It receives and retains premiums, adjusts losses and reports statistics in essentially the same manner as voluntary insurance companies for those purposes. It uses dwelling forms and rates filed by the Rate Bureau, except that it applies a 5% statutory surcharge on policies where it writes only the wind and hail coverage. When the Beach Plan reports its statistical data to ISO, ISO reviews those statistical data in the same manner that it does for voluntary companies.

The second residual market mechanism in North Carolina is called the Fair Access to Insurance Requirements organization, commonly called the “FAIR Plan.” It writes in all areas of the state except the beach. It writes dwelling policies but does not write homeowners policies.

Data from these two residual market organizations have always been included in Bureau property filings for the line of insurance under review in the same manner as data from voluntary insurance companies that write that line of insurance.

The Beach and Fair Plans write 56% of the statewide extended coverage portion of the dwelling insurance premium. They have the highest market share in the beach territories -- 93% in territory 110 and 95% in territory 120. The market share in territories 130, 140, 200 and 230 is about 75% and it is about 65% in territories 150, 160 and 170. See exhibit RB-3A.

Q. What is the reason for using five years of premium and loss data to determine the indicated rate level change?

A. Five years of data are used to balance the stability of the rates with responsiveness to current conditions. The North Carolina statutes allow the Rate Bureau to consider five years of experience in its property rate level filings in addition to other factors that are to be considered. Traditional ratemaking for the fire coverage of a dwelling policy has relied on five years of experience with the weights of .10, .15, .20, .25 and .30 being given to each year respectively as the way to achieve this balance. The accident year weights used by the Bureau are identical to those used by Insurance Services Office in developing their advisory loss costs for dwelling fire insurance. These weights are generally accepted in all jurisdictions in which ISO makes dwelling filings. For the extended coverage portion of the dwelling policy, which by nature is more likely to be unstable because of weather events, equal weights are given to each year for stability. This treatment is a common and accepted ratemaking practice used by ISO countrywide.

Q. Mr. Curry, please turn to page C-1 of Exhibit RB-1. Would you explain what that page represents.

A. Page C-1 is what we call a statewide rate level calculation for the fire portion of a dwelling policy. Page C-1 is a determination of what the actual indicated

rate level change is for dwelling fire. The data shown are for all business written in the voluntary market and the data written by the North Carolina Beach and FAIR Plans.

Q. Referring to column 1 on page C-1, what are "Adjusted Incurred Losses"?

A. The incurred losses in column 1 are the losses from all causes from claims that occurred during each of the respective accident years. The figure includes losses that have already been paid, losses that are not yet paid and are represented by outstanding claim reserves, and losses that have been incurred but for which no individual reserve exists because they have not yet been reported.

Q. Have the losses as shown in column 1 been adjusted in any way?

A. Yes, there are two adjustments. First, these losses have been adjusted to a common $500 deductible level. The second adjustment results from the use of a loss development factor.

Q. What is the purpose of adjusting the reported losses by applying a loss development factor?

A. As I mentioned a moment ago, the losses in column 1 of page C-1 include losses that are not yet reported. By definition, since they are not yet reported, we cannot simply take a reported number and add it to the losses. They are included by what is known as an adjustment for IBNR (incurred but not reported) losses. This is accomplished through the use of loss development factors. The losses as they are reported to us cover all claims that occur during the respective accident years ended December 31. When they are reported to the statistical agent they are evaluated as of March 31 of the next year. As of March 31 some of the losses have already been paid and some have not. Those that have not are represented by loss reserves. The loss reserves, of course, are estimates of what will ultimately be paid on these outstanding claims. Since

we want the estimates to be as accurate as possible, we look at history to see how losses have changed, or "developed," in the past from the time they were initially reported to the time they were ultimately paid. For example, if we look back and see that historically there has been a 1% increase in the amount of losses from the time they were initially reported as reserves until the time they were ultimately paid, we would logically assume that the same development pattern will hold true for losses incurred during the year ended December 31, 2013. Accordingly, we would make an adjustment by increasing the losses as they are initially reported to us by 1%.

Q. What causes losses to change or develop as you have described?

A. The losses that are paid as of the date of the initial reporting, of course, do not change. As to the reserve portion of the losses, however, changes would typically result from the fact that the ultimate loss payments are more or less than estimated at the time of the initial report. Another factor would be the late reporting of claims. For example, if a claim occurred on December 25 of any given year and for some reason was not timely reported to the company, it might very well be that the losses as initially reported would not include any provision for that particular claim. By the time of the next year's evaluation, however, the claim would have worked its way into the system and the total loss would include either the paid amount or the reserved amount for that particular claim. This would cause an upward development in the total losses as initially reported.

Q. Will you please refer to page D-12 of RB-1 and explain how the loss development factors used in the filing were calculated?

A. Yes. In the top section of that page, the North Carolina incurred losses evaluated as of 15, 27, 39, 51, 63, 75 and 87 months for the accident years for which data are available are shown. In calculating loss development factors, we have used the data of companies reporting to ISO. The first entry for the accident year

ended December 31, 2002 is $10,827,040. This is in the column that is labeled "15 Months." This is the first evaluation of the losses caused by claims that occurred during the year that ended December 31, 2002. The evaluation was made as of March 31, 2003 -- 15 months after the beginning of the accident year. Twelve months later (March 31, 2004) the losses caused by claims that occurred during the year ended December 31, 2002 had increased to $10,866,510. This is the evaluation as of 27 months after the beginning of the accident year. This increase represents an increase in losses, or a positive development, of 0.4% (1.004) as shown in the column on that page labeled "27:15." As shown on page D-12, we have looked at the development from 15 months to 27 months for eleven different years. The average development for those years was .975, or -2.5%.

Q. Does page D-12 also show development figures for periods later than 27 months?

A. Yes. Studies have shown that for dwelling fire virtually all losses have been paid by the time of the evaluation at 87 months after the beginning of an accident year. We calculate loss development factors for the periods from 27 months to 39 months, 39 months to 51 months, 51 months to 63 months, 63 months to 75 months and 75 months to 87 months. For example, by the time of the 39 month evaluation the losses for the accident year ended December 31, 2002 had become $10,710,415. This represents a decrease of 0.986, or -1.4%, over the losses for the same accident year evaluated as of 27 months. The average development over the period 27 months to 39 months for the ten most recent years for which the data are available was 0.996, or -0.4%.

Q. Will you explain how the loss development factor used to determine the ultimate payment value of the accident year ended December 31, 2013 losses was determined?

A. Yes. The development factors for each of the applicable periods, as shown on page D-12, are:

Development Period	Factor
15 to 27	0.975
27 to 39	0.996
39 to 51	0.998
51 to 63	1.000
63 to 75	1.000
75 to 87	1.000

If you multiply all of these factors you will get a factor of .969 to apply to the year ended December 31, 2013 losses.

Q. What other adjustments must be made to the losses?

A. The losses need to be adjusted by trend to reflect the cost levels anticipated to prevail during the period that the proposed rates are expected to be in effect. For this filing the assumed effective date is May 1, 2017. This date is relevant for trending purposes as is explained in my testimony.

Q. Could you please describe how the loss trend is developed and applied?

A. The loss trend is developed in a two step process. The first step is the development of a current cost factor that brings the losses up to the cost level of the external Current Cost Index that is used as the basis of the loss trend. The second step is the development of a loss projection factor based upon an exponential fit of the last twelve quarters of the Current Cost Index and the actual dwelling pure premium trend. The loss projection factor projects the losses from November 15, 2015 (the midpoint of the latest quarter of the external index) to May 1, 2018, the average date of loss for one year policies which are assumed to be written at the proposed rates (i.e. one year beyond the assumed effective date of May 1, 2017).

Q. You mentioned that the loss trend is based on a Current Cost Index. What are the components of the Current Cost Index used for dwelling fire?

A. The Current Cost Index is a weighted average of the Modified Consumer Price Index (MCPI) and the CoreLogic Residential Index (CLRI), with the MCPI receiving 20% weight and the CLRI receiving 80% weight. The intent of the weights is to reflect the split between contents type losses and buildings type losses.

Q. How are the weights of 80% to the CoreLogic Residential Index and 20% to the Modified Consumer Price Index determined?

A. The weights were based on an examination of fire losses, apportioning the losses between buildings and contents.

Q. What is the CoreLogic Residential Index?

A. The CoreLogic Residential Index is an index of construction costs. The particular index used in this filing is based on information compiled specifically for construction costs in North Carolina.

Q. What is the Modified Consumer Price Index?

A. The Modified Consumer Price Index is based on selected components of the Consumer Price Index that correspond to the items that dwelling policies cover. The components used and the weights given to them are House Furnishings (70%), Apparel Commodities (20%) and Entertainment Commodities (10%).

Q. Please illustrate what factors would be applied to trend the losses for the year ended December 31, 2013.

A. The losses from the accident year ended December 31, 2013 are first adjusted by the Current Cost Factor for 2013 of 1.037 which is found on page D-14. The Current Cost Factor is the ratio of the Current Cost Index from the quarter ending December 30, 2015 to the Current Cost Index value for the full year 2013. The Current Cost Factor brings the losses from the cost levels corresponding to an average date of loss of June 30, 2013 to the cost levels corresponding to the midpoint of the latest quarter (November 15, 2015) of the Current Cost Index. Since the average date of loss for policies

that will be written at the proposed rates is May 1, 2018 (one year past the assumed effective date) it is necessary to project the losses from the November 15, 2015 cost level to that date. This is accomplished by projecting the losses at the annual rate of change of 1.9% for 29.5 months. This loss projection factor of 1.047 is calculated on page D-15.

Q. You mentioned that the actual pure premium trend was considered in the selection of trend factors. How was this data examined?

A. The pure premium experience was examined by the Property Rating Subcommittee. A pure premium is the ratio of the losses to the number of insured house years. These data were fit to an exponential curve and an annual rate of change was calculated. This rate of change was compared to the annual rate of change of the Current Cost Index. In reviewing the loss trends, the annual rates of change in dwelling pure-premium during the 2009-2013 experience period are similar to the observed annual changes in the external indices. Therefore, to project losses to a 2018 level, a 0% additional annual trend adjustment was selected by the Property Rating Subcommittee for both the fire and the extended coverage portions of the dwelling filing. This results in the 1.9% annual rate of change used to trend the prospective losses.

Q. Where on page C-1 are these factors applied?

A. The current cost factor for each year is applied as part of the current cost/current amount factor in column 3. For example, for the year ended December 31, 2013 the current cost/current amount factor of 0.961 is the ratio of the current cost factor of 1.037 (shown on page D-18) and the current amount factor of 1.079 (shown on page D18). The loss projection factor is combined with the premium projection factor and the trend from first dollar to produce the composite projection factor. This composite projection factor is applied in column 5 in the development of the Trended Loss Cost.

Q. You mentioned the trend from first dollar. Could you describe what that is and how it is developed and applied?

A. The index is a first dollar index. All of the losses have been adjusted to a $500 deductible level. As such, increases in cost as measured by the current cost index would affect losses below the deductible and cause an additional increase as losses below the deductible increase above it. For example, a loss of $1,000 subject to a $500 deductible results in a payment of $500 to the insured. If there is 10% inflation the $1,000 loss grows to $1,100. This results in a payment to the insured of $600, which is a resulting effective inflation of 20.0%, an incremental trend of 10%. The procedure used in the filing is a standard one that accounts for this effect. The procedure in essence converts all the losses to a first dollar basis before the trend factor is applied. To obtain the resulting trended losses, the deductible portion of the trended losses are subtracted out. The trend from first dollar factor as shown on page D-19 is the incremental difference in the trend factor resulting from the application of our procedure. Using our example from before, and the formula for trend from first dollar on page D-19 results in a trend from first dollar factor of 1 + (((.1) (500))/((1.1)(500))) = 1.10, which matches what was calculated earlier.

Q. Please refer to column 2 of page C-1. With reference to the column headed "Adjusted Incurred Losses Including LAE," please state what the figure $41,254,658 represents.

A. These are the losses and loss adjustment expenses associated with claims that occurred in the accident year ended December 31, 2013. The losses are the sum of the adjusted incurred losses in column 2, adjusted by a trended loss adjustment expense factor of 1.085.

Q. How is the trended loss adjustment expense factor of 1.085 developed?

A. Each year the Rate Bureau sends a call to its member companies for expense-related data. These calls showed that loss adjustment expenses for the calendar years December 31, 2010, December 31, 2011, December 31, 2012, December 31, 2013 and December 31, 2014, after dropping the high and low values, averaged 8.6% for the period as shown on page D-26.

This factor of 8.6% must be adjusted for the change in cost levels of the items that go into loss adjustment expenses. These expenses include items like adjuster's salaries, rents and overhead items related to claims settlement. In essence, these items will not change as losses change but rather will vary as general economic trends vary. We adjust the loss adjustment expense factor by taking a ratio of the expense trend to the loss trend on page D-29. This adjustment results in trended loss adjustment factor of 1.085.

Q. Could you please explain how the expense trend used to adjust the loss adjustment expense factor is developed?

A. The expense trend used to adjust the loss adjustment expense factor is based on an analysis of the Current Expense Index, which is an index based on a 50/50 weighting of the all items CPI less energy and the Compensation Cost Index for marine, fire and casualty insurance. The data for this index, which were the latest available when the selection was made, are shown on pages D-23 and D-24. Based on an analysis of this data, an annual rate of change of 2.0% was selected by the Property Rating Subcommittee.

Q. Please explain the development and application of the expense projection factor in adjusting the loss adjustment expense factor?

A. The five year (excluding the high and low values) average loss adjustment expense factor of 8.6% reflects an averaging of the five years 2010, 2011, 2012, 2013 and 2014. As such the factor is representative of the time period corresponding to 2012.

The expense projection factor uses the 2.0% annual rate of change based on an exponential curve of the Current Expense Index. Since the loss adjustment expense ratio is at the cost level corresponding to July 1, 2012, it is necessary to project this cost to the average date of claim for the period which our rates are proposed to be effective, May 1, 2018 (one year beyond our assumed effective date). This calculation is displayed on line (2) on page D-29.

Q. What other adjustments must be made to the loss adjustment expense factor in order to use it?

A. The loss adjustment expense factor is determined as the ratio of expenses to losses. Having adjusted the expense portion of the factor in the numerator, we need to adjust the losses in the denominator by the loss trend, to reflect both the current cost factor and the loss projection factor.

Q. Could you please describe what is being done in Column 3 of page C-1?

A. In Column 3 the previously described current cost factors and current amount of insurance factors are combined into the current cost/current amount factors. This is done by taking the ratio of the current cost factor to the current amount factor. For example, the current cost/current amount factor of 0.961 for 2013 is the ratio of the 2013 current cost factor of 1.037 to the 2013 current amount factor of 1.079. Through these steps the losses and premiums have been brought to the cost level of November 15, 2015.

Q Please describe the development of the current amount factor.

A. The current amount factor is calculated, separately for buildings and contents, by taking the ratio of the average policy size relativity for each year to the projected average policy size relativity as of November 15, 2015, the same projection date as is used for the losses in the development of the current cost

factor. The average policy size relativity is calculated by taking a weighted average of the policy size relativity curve for each amount of insurance using the exposures for each amount of insurance as weights. By taking the ratio of these relativities for each year to the November 15, 2015 value, we are in effect measuring the percentage growth in the premiums at present rates from year to year caused by changes in amount of insurance. Selections of an annual growth rate of 2.8% for building and 0.5% for contents were made by the Property Rating Subcommittee. Since the average relativity differs for buildings and contents and is forecasted separately, the resulting current amount factors for buildings and contents are weighed on a premium distribution to produce a combined current amount factor.

Q. How is the current amount factor used in the calculation of the indicated rate level change?

A. The current amount factor for each year is the denominator in the current cost/current amount factor for that year shown in column 3 of page C-1. The premium projection factor is the denominator in the composite projection factor (CPF) used in column 5 of page C-l. The combined effect of these two factors is to bring the average rating factor to the level for the amount of insurance expected to prevail during the period for which these rates are expected to be in use. For example, for 2013 the current cost factor is 1.037 and the current amount factor is 1.079. The ratio of these two factors results in a current cost/current amount factor of 0.961 which appears in column 3 on page C-1 in the 2013 row.

Q. Could you please describe what is being done in column 5 of page C-1?

A. Column 5 combines all of the elements in columns 1 through 4. In column 5, the losses and loss adjustment expenses are trended to the cost level expected to prevail during the period when the proposed rates will be in effect (average date of claim of May 1, 2018). The house years are also projected to reflect the anticipated amounts of insurance for business written between May 1,

2011 and April 30, 2018. As an example the calculation of Column 5 for 2013 is:

(1) Adjusted Incurred Losses Including LAE (C-1, Col 2)

41,254,658

(2) Current Cost/Amount Factor (C-1, Col.3 from p. D-18)

0.961

(3) Earned House Years (C-1, Col. 4)

659,849

(4) Composite Projection Factor (D-19, line 18)

0.997

(5) Trended Loss Cost (C-1, Col. 5) (1)*(2)*(4)/(3)

59.90

Q. Please describe the development of the premium projection factor.

A. As I mentioned earlier, for each year we have an average policy size relativity that is calculated as a weighted average of each amount of insurance relativity. The premium projection factor is calculated by fitting an exponential curve to the average policy size relativities. This curve is used to develop an annual rate of change for the policy size relativities. In the case of dwelling fire buildings, the average annual rate of change is 2.8% as shown on page D-17. Since the current amount factor has been calculated as the value on November 15, 2015, the premium projection factor will be calculated as the expected growth from November 15, 2015 to November 1, 2017 (which is six months after the assumed effective date of May 1, 2017). This date of November 1, 2017 represents the midpoint of the year in which it is assumed that policies will be written using the proposed rates. This results in a Premium Projection Factor of

1.056 that is shown on Page D-17. A similar calculation is done for fire contents and this produces a Premium Projection Factor of 1.01. The two factors are weighed together to produce the Premium Projection Factor of 1.053. This is shown on Page D-19.

Q. Could you please explain column 6 on page C-1?

A. Column 6 is the average rating factor for the policies purchased in each year. The average rating factor is the ratio of the average rate at manual level to the average current (after the most recent relativity filing) base rate. For example, let's assume that the current territory base rate for frame construction with $75,000 buildings coverage is $100, that the rating factor for masonry is 0.9 and that the rating factor to purchase an additional $25,000 of coverage A is 1.2. Then the average rating factor for a $100,000 masonry policy is calculated as:

$$(100 * 1.2 * 0.9) / 100 = 1.08$$

This factor is needed to adjust the average trended loss costs in column (5) to a base class level. Since most policyholders do not purchase exactly the base amount of coverage, the average trended loss cost is divided by the average rating factor to convert this average trended loss cost into a trended base class loss cost which is shown in column 7.

Q. Could you please explain line 9 on page C-1?

A. Line 9 is the resulting weighted trended base loss cost obtained by applying the accident year weights shown in Column 8 to the trended loss cost for each year shown in Column 7. This weighted trended loss cost is our forecasted base loss cost for policies written during the one-year period after the assumed effective date of May 1, 2017, if there were no change in rate level.

Q. Could you please explain line 10 on page C-1?

A. Line 10 is the credibility of the experience based on the number of house years during the 5-year period. The full credibility standard is based on a procedure considering the frequency of claims and the variability of the size of those claims. The procedure is explained in a CAS Proceedings Paper "Credibility of the Pure Premium" by Mayerson, Jones and Bowers. The full credibility standard is based on a normal distribution with a 90% probability of the pure premium being within 10% of the expected value. The full credibility standard for Fire is 500,000 house years and 330,000 house years for Extended Coverage.

Q. Could you please explain what line 11 entitled "Fixed Expense per Policy" on page C-1 refers to and what it represents?

A. Line 11, "Fixed Expense per Policy" refers to the dollars of prospective premiums that the general expenses will be on policies written between May 1, 2017 and April 30, 2018. General expenses, along with other acquisition expenses, constitute fixed expenses. They are fixed in that they do not vary as a direct function of the premium dollar. For example, the cost of office equipment, rent and other overhead-type expenses would be among the items classified as either general expenses or other acquisition expenses. Those expenses are fixed in the sense that they do not vary directly as a function of premium. Such things as commissions and premium taxes, on the other hand, are examples of expenses that do rise or fall directly with premium.

The number shown on line 11 ($3.85) represents the dollars of general expenses trended to the levels anticipated to prevail during the period from May 1, 2017 to April 30, 2018 (the average date of which is November 1, 2017) and the projected premiums for business written during the same period. This is appropriate because general expenses are generally incurred at the time a policy is written.

Q. Could you explain how the figure $3.85 was derived?

A. This derivation of 3.85 is shown on page D-29 in line (5), "Factor to trend expense based on Current Expense Index." It starts out with an untrended general expense ratio of .047 that is based on the average of the 2012, 2013 and 2014 general expense ratios. These are shown on page D-25. The average of these represents the average expense ratio corresponding to 2013. In order to trend these to the cost levels anticipated to prevail between May 1, 2017 and April 30, 2018, we project these by using the Current Expense Index described earlier. This is done by projecting the average annual change of +2.0% over the time period from June 30, 2013 (the average date of the experience on which the general expense ratio is based) to November 1, 2017 (the average date of writing under the proposed rates). Since this ratio is relative to premium, we must project the amount of insurance from 2013 levels to the level anticipated on business written between May 1, 2017 and April 30, 2018. This is done by using the current amount factor for 2013 of 1.09 and the premium projection factor of 1.97. The result is:

$$\frac{0.047 \times 1.09}{1.097} = .047.$$

A similar calculation is show on line 5 on page D-29 for other acquisition expenses.

Q. What does Line 12 on page C-1 entitled "Loss & Fixed Expenses" show?

A. Line 12 is a combination of the trended base class loss cost and the trended general expenses and other acquisition expenses. The figure $19.35 is the dollar amount that is required to cover the portion of the insurance base rate that accounts for losses, loss adjustment expenses, general expenses and other acquisition expenses.

Q. What does line 13 on page C-1 entitled "Expected Loss & Fixed Expense Ratio" show?

A. This line takes into account the other expense items to which I just referred. If you look at page D-25 of the filing, you can see that the commission and brokerage is 11.0% of the premium dollar. Taxes, licenses and fees

are 2.8% of the premium dollar. The provision utilized in this filing for underwriting profit for dwelling fire is 10.5%. The underwriting profit provision was selected by the Rate Bureau's committees based on reviewing the profit analysis by Dr. Appel and Dr. Vander Weide. This filing also contains a 1% margin for contingencies. All those items add up to 25.3%. These items are what are known as variable expenses. They vary in direct proportion with the premium dollar. You know that, out of every dollar of premium you write, 25.3 cents will have to go to pay for these expenses, and you are left with only 74.7 cents to pay for losses, for loss adjustment expenses and for general and other acquisition expenses. The expected loss and fixed expense ratio shows the percentage of the premium dollar you will have available to pay for trended losses, trended loss adjustment expenses and trended general expenses and other acquisition expenses.

Q. What is the source of the percentages on page D-25 with respect to commissions and brokerage and with respect to taxes, licenses, and fees?

A. They were calculated from the NCRB's expense calls for 2012, 2013 and 2014.

Q: What is the source of the percentage on page D-25 for contingencies?

A: The Bureau committees selected that factor. A 1% factor has been consistently employed in past Bureau property insurance rate filings. A 1% contingency factor is a standard factor that has been used for many years across the country in property insurance ratemaking. The factor was selected by the Bureau committees based upon recognition of the systematic bias that causes actual underwriting experience to be worse than the provision assumed in the rates. Reasons for this bias are many.

One reason is that property insurance involves many risks, but not all of them are observable in the experience or are adequately recognized in normal ratemaking. An example is the potential for conflagration such as could result from large brush

fires. The state is particularly at risk for several years following hurricanes that blow down thousands of trees, particularly pine trees in the eastern part of the state. Those trees become the tinder for brush fires. The risk is particularly significant if droughts occur in years subsequent to the hurricane. Widespread brush fires have destroyed many homes in other states and constitute an exposure in North Carolina, but that exposure is not reflected in the five years of loss data underlying this filing because there have not been widespread and catastrophic brush fires in North Carolina in the experience period.

In addition, the writing of property insurance in North Carolina is subject to law changes, court interpretations, jury determinations and judicial determinations that expand losses beyond what was contemplated when the policies were written. For example, under rules of legal construction of insurance policies, ambiguity in policy language, although unintended, will result in the courts construing policy provisions in favor of greater coverage than was envisioned by the insurance industry when it drafted the policy. An unexpected ruling as to coverage in one case may then be compounded many times by similar results as to numerous other policyholders.

Further, delay and difficulty in obtaining needed rate increases is a factor. In North Carolina and a very few other states, insurance companies writing property insurance are required to go through rating bureaus in order to achieve needed rate increases. This regulatory system can cause significant delay in obtaining needed rate level increases and differs from states that rely more on competition to set rates. The system in this state requires that data be collected from all of the approximately 65 companies writing dwelling insurance and then be aggregated and analyzed prior to making a filing for needed higher rates on behalf of all companies. Additionally, there can be significant further delays in the setting of hearings and in obtaining regulatory approval before revised rates can be charged and premiums collected.

Q. Would you explain line 14 on page C-1 entitled "Net Base Rate per Policy"?

A. The Net Base Rate per policy is calculated by dividing the Loss and Fixed expenses in line 12 by the expected loss and fixed expense ratio in line 13. This is the net base rate before incorporating the anticipated deviation and compensation for assessment risk per policy.

Q: Would you explain line 15 on page C-1 entitled "Compensation for Assessment Risk Per Policy"?

A: Compensation for assessment risk is a provision which is calculated by Dr. Appel (see his prefiled testimony and exhibits) to reflect the cost to voluntary market insurers of maintaining sufficient capital to pay the assessments for residual market losses to the extent required by law. If the residual market (Beach Plan and FAIR Plan) does not have sufficient capital, reinsurance and reserves to pay losses for a catastrophic event, then companies writing homeowners, dwelling and other lines of property insurance in the voluntary market will be assessed for such losses even if they do not write in the coastal or beach areas. In effect the voluntary market companies are being required to provide free reinsurance to the policyholders who can only find coverage in the residual market. The voluntary market companies must therefore maintain capital sufficient to cover such losses, even though those companies have not elected voluntarily to write the policies that give rise to those losses. The compensation for assessment risk factor is the provision for compensation that must be paid to voluntary market insurers for bearing this risk of assessments from the Beach/FAIR Plans, i.e., it is the cost of the capital required to support the exposure to potential residual market assessments.

A factor to reflect this exposure has been incorporated in Bureau property filings. As a result of legislative action in 2009, the exposure of the voluntary market companies to residual market assessments was capped at one billion dollars. Dr.

Appel's analysis of the necessary compensation for the risk of residual market assessments reflects this new cap and, as a result, the 3.6% factor in this filing for compensation for assessment risk is significantly lower than it was before the cap was instituted.

The compensation for assessment risk amount of 1.42 is calculated by first multiplying the 3.6% provision by the current average statewide base rate of 34.11, resulting in a value of 1.23. To be incorporated in the rates, however, this provision must be adjusted to account for the commissions and taxes, licenses and fees that the companies will need to pay on this additional premium. That is done by dividing the 1.23 by 1 minus the sum of commission and brokerage expense and taxes, licenses and fees expense as shown below.

$$\frac{1.23}{1-0.11-.028} = 1.42$$

Q. What is the source of the percentage on line 17 for anticipated deviations?

A. The 3.95% provision for deviations is based on an analysis of the last several years of deviation experience for dwelling fire business. The analysis shows that the provision for deviations in extended coverage portion of the filing is 1.1% which is shown on C-3, line 21.

Q. Would you explain line 18 on page C-1 entitled "Deviation Amount per Policy"?

A. Line 18 is the dollar amount of deviation that needs to be in the final rate to ensure that the selected 3.95% deviation percentage is accounted for.

Q Would you explain line 19 on page C-1 entitled "Required Base Rate per Policy"?

A. Line 19 is the required base rate that is needed to ensure that sufficient revenue is collected to cover the losses and expenses that are expected to result from the policies written during the year following the effective date of this filing.

Q. Would you explain line 20 on page C-1 entitled "Current Base Rate"?

A. Line 20 is the current base rate for all of the policies written in the most recent year included in the review. This rate assumes that each policyholder is buying only the base coverage.

Q. Would you explain line 21 on page C-1 entitled "Indicated Rate Level Change"?

A. Line 21 is the percentage change in the current rates which will be necessary to make the rates adequate for the cost levels that are expected to prevail in the one-year period following the effective date of the filing. It is determined by taking the required base rate per policy on line 19 and dividing it by the current base rate from line 20. This results in an indicated rate level change for fire portion of the filing of -16.6%.

Q. How are these changes distributed by class?

A. On page C-5 the calculations of the indicated change for fire buildings and contents classes are shown. Column 1 displays the Trended Adjusted Incurred Losses for each of the two classes - buildings and contents. The losses shown are for the latest five years. Column 2 gives the Five Year House Years total, which is the sum of the exposures by class for the five-year period. Column 3 provides the Trended Average Rating Factor. Each year's costs have been trended by using each class's own current cost factors and a loss projection factor. Column 4 gives the Base Loss Cost for each class and total. This loss cost is obtained by dividing the five year total trended adjusted incurred losses by the five-year total house years times the trended average rating factor. Column 5 is the credibility assigned to each class's experience, based on the full credibility standard of 500,000 house years for fire. Column 6 is the Credibility Weighted Loss Cost for each class. The complement of credibility for use in this calculation is the Total Base Loss Cost multiplied by the ratio of the class's current base rate to the total current base rate.

The statewide credibility weighted loss cost is obtained by weighting the class credibility weighted loss cost by the individual class house years. Column 7 provides the Indicated Base Loss Cost by class.

This is the statewide base loss cost adjusted by the class relativity indicated by the credibility weighted loss cost. Column 8 shows the Current Base Rate by class. Column 9 displays the Expected Loss and Fixed Expense Ratio. The Indicated Net Base Rate is shown in column 10. The indicated net base rate is the sum of the loss cost and fixed expenses divided by the expected loss and fixed expense ratio. Column 11 is the Compensation for Assessment Risk Per Policy. Column 12 is the Base Rate Excluding Deviations. Column 14 is a derivation of dollars of deviation that need to be reflected in the required base rate. Column 15 is the sum of the indicated net base rate before deviations in column 12 and the deviation amount in column 14. Column 16 shows the Indicated Base Rate Change by class. Column 17 shows the Indicated Rate Change Balanced to Statewide Level. This rate change includes the impact of statewide change of -16.6%.

Q. Does the filing contain a revision of the present territory definitions and relativities?

A. Yes. This filing first introduces the same territory definitions, or boundary changes, that were implemented in the last homeowners rate filing approval in 2015. As with that change, the territorial definition changes proposed in this filing more fairly reflect the loss potential of the counties and areas involved by grouping together counties and areas with similar loss potential. Once the new territory definitions are implemented, the indicated rates for the newly defined territories are shown on page C-8 in column 18 for fire and page C-10 column 20 for extended coverage.

In connection with the overall rate level change, new territory rates are displayed on page A-2. In these rates, the new territorial relativities are determined in such a way that no overall statewide rate level change results. In other words, based on each territory’s own indications, the relativities are

revised, with policies in some territories receiving increases and policies in others receiving decreases. The overall statewide change as a result of these territorial changes is 0. When the territorial relativity changes are then compounded with the filed statewide rate level change, the overall change is equal to the filed change, subject to possible minor rounding differences.

Q. How has the Rate Bureau treated general and other acquisition expense by territory?

A. The Rate Bureau has treated 100% of general expense and other acquisition expense as not varying by territory.

Q. Is the average rating factor for the extended coverage portion of the filing as shown on page C-3 determined in the same way as for fire insurance?

A. Yes.

Q. Are the incurred losses and loss adjustment expenses in Columns 1 through 5 on page C-3 determined in the same manner as you testified with respect to fire insurance?

A. Yes, except for the following. The actual hurricane losses for extended coverage, while reviewed and considered, have been excluded and replaced by the "Modeled Base Class Loss Cost", which is displayed in line 12 of page C-3. Also, the actual excess losses in column 2 have been replaced by an excess factor loading included in column 3 of page C-3. The excess procedure exhibit is shown on D-30.

Q. You indicated that losses due to hurricanes have been excluded on Page C-3. Have you excluded them anywhere else in the filing?

A. Yes, they have been excluded in the development of the indications by class and by territory, and in the calculation of the non-hurricane excess factor.

Q. How have these losses been identified in order to be excluded?

A. The method to remove the hurricane losses depends on the detail of the available data. For 1950-1965 only statewide wind data is available; consequently, for a year in which a hurricane occurred, losses from that year are removed from the calculation of the statewide excess factor. This is shown by the omission of the year in question on page D-30.

Since territory data is available (in varying detail) for 1966-2013, the calculation of the non-hurricane losses is done at the territory level for this period. After it has been determined that a particular hurricane is accounted for by hurricane models, the territories affected are determined by use of recorded wind speeds and central pressures at 6 hour intervals, storm tracks, and wind to non-wind ratios.

The non-hurricane wind losses for a territory are calculated by replacing the hurricane year wind to non-wind ratio by the average wind to non-wind ratio of the non-hurricane years. Given the revised wind to non-wind ratio for the hurricane year, the reported non-hurricane total losses and the reported non-hurricane wind losses are then “backed into.” For the years in which the territory codes 01-04 were in effect (1966-1982), the average wind to non-wind ratios are based on the non-hurricane years from 1966-1982. For the years in which the territory codes 04 and 30-41 were in effect (1983-1999), the average wind to non-wind ratios are based on the non-hurricane years from 1983 to 1999.

For 1986-1995, territory losses by month are available for ISO data only. The territory non-hurricane losses for this period are calculated as follows: first the average losses for the month in which the hurricane occurred are calculated based on the non-hurricane years. The average monthly losses are then added to the eleven remaining months of the hurricane year and divided by the hurricane year annual losses resulting in a non-hurricane adjustment factor. This factor is then applied appropriately to either reported losses or adjusted losses by territory for all statistical agents

to obtain non-hurricane losses. For severe hurricanes, wind type losses are sometimes reported as water losses or all other property damage losses. To accurately estimate the non-hurricane losses, the above non-hurricane factors are calculated for water and all other property damage and then applied to the water losses and the all other property damage losses.

For 1996-2002, based on information from NOAA and other sources, the specific dates on which a given hurricane was active in North Carolina are determined. The loss experience for ISO is then examined by date and cause-of-loss. Wind losses and losses for other weather-related perils which occurred on these dates are assumed to be hurricane losses. For ISO data, the percentage of hurricane losses to total losses is calculated. To estimate the hurricane losses for statistical agents other than ISO, the percentage of hurricane losses in the ISO data (relative to the ISO yearly total) is applied to the total loss amounts for the other statistical agents.

For 2003-2013, a procedure similar to that of 1996-2002 is used. The difference is that ISO and ISS data is available and examined rather than just the ISO data. For the ISO and ISS data, the percentage of hurricane losses to total losses is calculated. To estimate the hurricane losses for statistical agents other than ISO and ISS, the percentage of hurricane losses in the ISO and ISS data (relative to the ISO and ISS yearly total) is applied to the total loss amounts for the other statistical agents.

This procedure is similar to the procedure ISO uses in other states.

Actual hurricane losses of $276,569 were removed from 2009; $1,394,573 were removed from 2010; $81,249,620 were removed from 2011; and $2,061,313 were removed from 2012. This information is shown on pages D-33 and D-34.

Q. Do you have an opinion as to whether the incurred losses excluding hurricanes shown in column 1 on page C-3 of RB-1 accurately represent the anticipated value of dwelling extended coverage incurred losses, excluding actual hurricane losses which resulted from claims which took place during each of the years ended December 31 in North Carolina?

A. Yes, I do.

Q. What is that opinion?

A. I believe that the losses excluding actual hurricane losses shown in column 1 do accurately represent the expected ultimate value of those losses.

Q. Could you please describe the figure contained in line 12 labeled "Modeled Base Class Loss Cost" on page C-3?

A. These are the prospective hurricane losses resulting from the blending of the results of two hurricane simulation models developed by AIR Worldwide (AIR) and Risk Management Solutions (RMS). The NCRB decided to use two hurricane simulation models in this filing in response to statements by the Department of Insurance personnel that multiple models should be employed in future rate filings. The use of multiple models is required by HB 287 starting with filings made on or after October 1, 2017.

Q. Why were hurricane models used to develop the hurricane losses?

A. Hurricane models were used to develop the hurricane losses because modeling is the accepted and most accurate way of considering the hurricane exposure. Hurricanes are highly variable in frequency, intensity and place of occurrence. Modeling allows for the smoothing out of the hurricane losses as well as better reflecting a more complete distribution of the types of hurricanes that could occur and the potential for losses from these hurricanes at a given location. For example, since we consider the losses from five years of data in the basic ratemaking calculation, if a very large

hurricane like Fran or Floyd happened to hit during those years, it would make rates spike up above the long term potential. Also, if a storm were to hit a particular area of the state, the losses would be reflected only in that area of the state, with little or no reflection in other areas of the state. Conversely, if there was a five-year period without any hurricane activity, it would not be actuarially appropriate to assume that the absence of hurricanes would be the expectation for the future time period. The simulation models produce a more accurate estimate of the loss potential both in terms of territory and dollar value than is possible using any analysis of the insurance data.

I examined actual hurricane losses in North Carolina in connection with excluding those losses from the incurred losses in the filing. I determined that the limited amount and the age of much of the available loss data call into question the validity of employing such data for a number of reasons. For one thing, much of the past loss data is quite old and of limited utility. It includes losses from hurricanes that occurred decades ago when housing patterns were different, when houses were built differently, when building codes were different, when construction prices were different, when houses had very different contents, when labor costs and practices were different, etc. Indeed, there is not enough experience with hurricanes since accurate records began to be maintained for actuaries to employ actual events as opposed to models. Actual events are not properly predictive of the range of hurricane events that can occur in the next year and the probability of occurrence of those events.

Modeling analyzes the risk of future losses from hurricanes based on scientific principles rather than on the happenstance of past hurricanes. Modeling is uniformly used in the insurance industry to consider prospective hurricane losses.

Q. What did ISO furnish to Aon Benfield to enable Aon Benfield to perform its analysis?

A. ISO furnished to Aon Benfield the North Carolina extended coverage insurance exposure data on the total number of earned house years and earned insurance years by territory for the most recent year in the experience period. These data included ISO, FAIR Plan/Beach Plan, NISS and ISS data and were compiled by ISO. These data are correct to the best of my knowledge, information and belief.

Q. How are these modeled hurricane losses derived?

A. The two models simulate many years of hurricane losses and develop hurricane losses for the portfolio of North Carolina exposures provided. The results of the two models are blended by Aon and then provided to ISO. Aon trended the losses for use in the filing. ISO reviewed the model results provided by Aon Benfield and found them to be reasonable. The development of the modeled hurricane losses is shown on page D-36.

Aon Benfield made an adjustment to account for loss adjustment expenses (LAE). Aon Benfield's data shows that LAE as a percentage of hurricane losses is lower than the percentage for non-hurricane losses. Therefore, the lower LAE percentage (6%) was applied to the modeled hurricane losses.

Q. How is the amount of insurance in effect determined?

A. For the purpose of developing the hurricane loss cost, the amount of insurance that is in effect is determined as the sum of the various internal limits found in the extended coverage portion of a dwelling policy. There are four coverages involved: Coverage A (building), Coverage B (other structures), Coverage C (contents) and Coverage D (loss of use). The total amount of coverage can vary by policy form. For form 1, the total limit for buildings is the Coverage A amount, and neither Coverage B nor Coverage D provides additional limits because any Coverage B or D losses are applied against

the Coverage A limit. The coverage C limit is as reported on the individual policy record.

For policy forms 2 and 3, the total limit for buildings is the sum of Coverage A, Coverage B, and Coverage D limits. The Coverage B limit is 10% of Coverage A, and the Coverage D limit is also 10% of Coverage A. The coverage C limit is as reported on the individual policy record. These differences in total amounts were reflected by Aon Benfield in running the models.

Q. In addition to excluding all hurricane losses and replacing them with the modeled hurricane losses, what other adjustments to the losses have been made because of catastrophes?

A. An excess wind analysis and procedure was employed. An adjustment was made to the non-hurricane wind losses in the years in which there were very severe storms such as tornadoes, thunderstorms and other damaging wind storms. The adjustment caps average losses by territory in years where abnormally high losses coincide with severe non-hurricane storm activity. The adjustment relies on a factor developed by using a statewide average consisting of years without losses influenced by severe non-hurricane storms. A long-term excess factor of 1.059 was loaded into the losses. This calculation is shown on pages D-30 and D-31. This procedure has been employed in past filings and is customarily employed to smooth out and properly reflect prospective non-hurricane wind losses.

Q. Are general expenses and other acquisition expenses for extended coverage determined in the same manner as for fire insurance?

A. Yes.

Q. Is the loss trend procedure the same for extended coverage as it was for fire insurance?

A. Yes, it is.

Q. What is the source of the 19.09 item for net cost of reinsurance in line 19?

A. The source of the 19.09 item for net cost of reinsurance is an analysis performed for the Rate Bureau by Aon Benfield. In that analysis Aon Benfield determined the net cost of reinsurance incurred by insurers for the catastrophe reinsurance for the hurricane exposure. The net cost of that reinsurance is the expense and profit component of the reinsurance premium paid by those insurers (the loss component is in the direct losses used in the overall rate determination).

Details of the analysis are included in the testimony of other witnesses.

To calculate the net cost of reinsurance per policy, the total dollars of reinsurance is divided by the number of house years for 2013 times the 2013 average rating factor, the premium projection factor and the current amount factor for 2013. This quantity is then divided by the expected loss and fixed expense ratio. The actual calculation is:

$$\frac{74{,}029{,}096}{616{,}418 * 7.337 * 1.049 * 1.073 * 0.762} = 19.08$$

Q. Are the remaining portions of the rate level calculation for extended coverage similar to that for fire insurance?

A. Yes, they are.

Q. What other changes does the filing make for dwelling insurance?

A. The filing revises the credits for the Windstorm or Hail Exclusion and Wind Mitigation that is available in Territories 110, 120, 130, 140, 150 and 160. The derivation of these credits is shown on pages C-14 - C-17.

Q. Please turn to page A-1 of Exhibit RB-1 and explain what is shown on that page?

A. Page A-1 of Exhibit RB-1 shows the filed statewide rate level change. The Governing Committee decided to apply capping to the indicated rate level changes in order to mitigate the impact to individual policyholders. The maximum change is 35% by territory for fire and extended coverage combined.

Q. What is shown on Page A-2 of Exhibit RB-1?

A. Page A-2 shows the capped rate level change filed for each territory.

Q. Do you have an opinion as to whether the data utilized and the method of calculating the filed rate level changes and the territory definitional changes contained in the filing are sound and actuarially reliable and if so, what is that opinion?

A. Yes, I have an opinion. In my opinion, the data utilized and the ratemaking methodologies used by the Rate Bureau are consistent with generally accepted actuarial principles and procedures and they are actuarially sound and reliable. In my opinion the ratemaking methodology and the revised territories are actuarially sound and produce indicated rates that meet the standard of being not excessive, inadequate or unfairly discriminatory. The filed rates differ from the indicated rates because of the 35% combined fire and extended coverage territory cap. The filed rates are a reasonable step toward an adequate level.

Q. Do you have an opinion as to whether the filed rate level changes contained in Exhibit RB-1 are fully justified and, if so, what is that opinion?

A. In my opinion, they are fully justified and are not excessive in any respect.

Q. Are there any qualifications you wish to attach to your opinion?

A. Yes. In reaching my opinion, I have, as in the past and as is customary in the general course of my work,

relied on the accuracy of the data supplied by the Rate Bureau and the ISS, NISS and the individual companies that reported data to ISO. I have relied on Dr. Vander Weide and Dr. Appel for the determination of the appropriate profit and Dr. Appel for the compensation for assessment risk components of the rates. Additionally, I have relied upon Aon Benfield and Paul Anderson for the blended output of the AIR and RMS models and Aon Benfield for the factor for the net cost of reinsurance. I have applied appropriate actuarial standards when reviewing these various data sources.

Q. Does that conclude your testimony?

A. Yes, it does.

North Carolina FAIR Plan and Beach Plan
Dwelling Extended Coverage Written Premium
Market Share By Territory

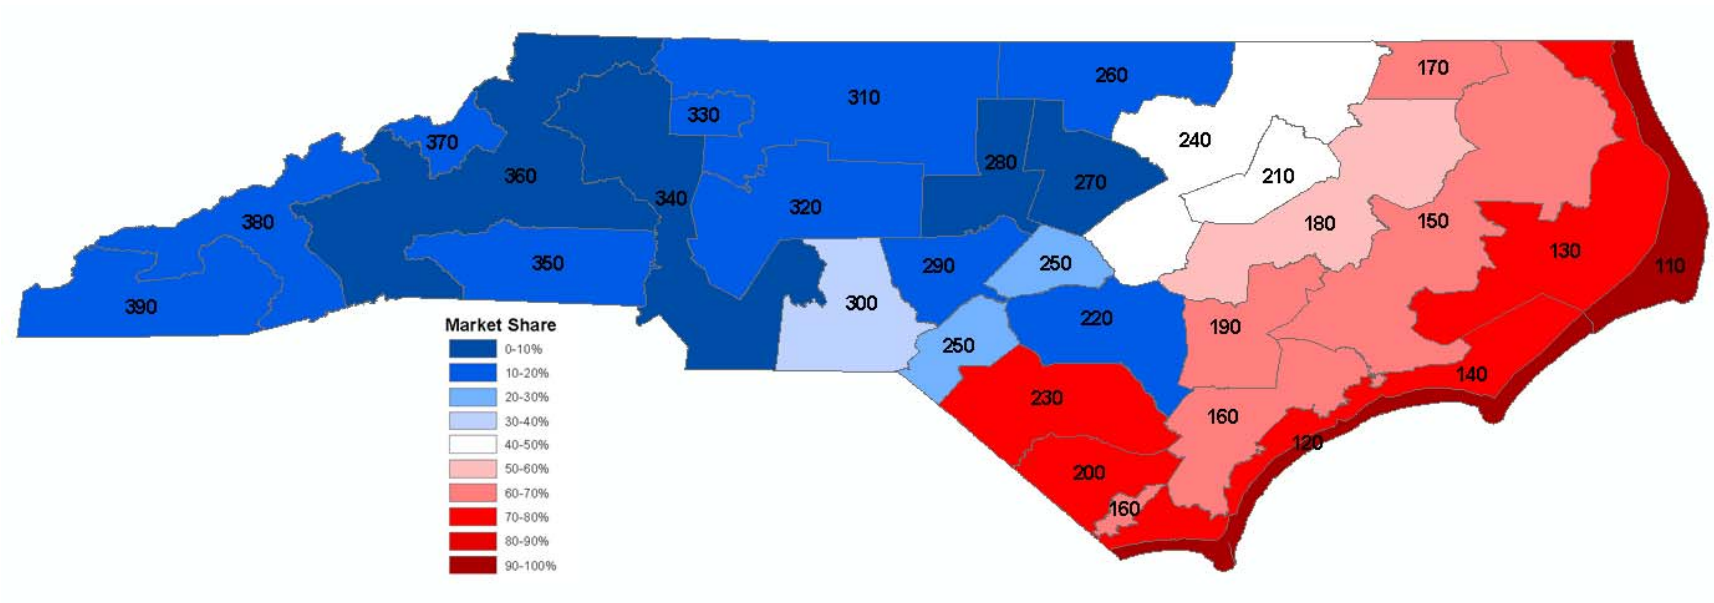

Exhibit RB-4

PREFILED TESTIMONY
OF
BRIAN MICHAEL DONLAN
2016 DWELLING INSURANCE
RATE FILING BY THE
NORTH CAROLINA RATE BUREAU

Q: Please state your name and your employer.

A: My name is Brian Michael Donlan. I work at Allstate Insurance Company at 2775 Sanders Road, Northbrook, IL 60062.

Q: What is your educational background?

A: I received a Bachelor of Arts in Economics with High Distinction from the University of Minnesota, Morris Campus in 1994. I received a Masters of Arts in Economics from the University of Iowa in Iowa City, Iowa in 1996.

Q: Do you have any additional certifications or qualifications?

A: I have been a Fellow of the Casualty Actuarial Society since 2005. I have participated in several committees of the organization. I'm currently on the Examination Committee of the Casualty Actuarial Society. I volunteered as a University Liaison for the Casualty Actuarial Society from 2003 until 2011. I have been a member of the Committee on Professionalism Education for the Casualty Actuarial Society since 2009. I am a member of the American Academy of Actuaries, and meet all of the continuing education requirements. I am also on the Board of Trustees of the Actuarial Foundation.

Q: What is your employment background?

A: I worked as a Pricing Analyst at GEICO Insurance Company in Washington, DC from 1996 until 1998. At GEICO, my primary responsibilities included developing the pricing strategies for Private Passenger Auto in a variety of states. From 1998 until 1999 I worked as an analyst at PricewaterhouseCoopers (PwC) in Chicago, Illinois. At PwC my responsibilities included assisting in the evaluation of the adequacy of reserves for several insurance companies. In the fall of 1999 I began my career at Allstate. From 1999 until 2006, I served several different Allstate regions developing rates. In 2007 through 2012, I served as a State Manager (Product Manager) for Encompass Insurance. Encompass is the Independent Agency channel in the Allstate Corporation. I determined the pricing, product and underwriting strategies for 12 states. Since the beginning of 2013, I have been serving as the Pricing Director for Encompass Insurance. In this role I have had countrywide responsibilities for Encompass, including North Carolina.

Q: Do you have experience with Dwelling Insurance ratemaking?

A: Yes. Encompass makes Dwelling Insurance ("Dwelling") filings across the country. I have responsibility for those filings.

Q: What is your role with respect Property insurance ratemaking in North Carolina?

A: For the past several years I have been Chairman of the Property Rating Subcommittee of the North Carolina Rate Bureau ("Bureau"). I am on the Property Committee of the Bureau. I represent Allstate on these committees.

Q: Can you explain the role of the Bureau?

A: The Bureau was set up in 1977. According to the statutes and the Bureau Constitution, the Bureau's role includes the establishment of rates for residential real property insurance in North Carolina. The rates are established for all companies that write such insurance in the state. The Bureau's files rates on behalf of the industry. The rates are subject to approval by the Commissioner of Insurance. Individual companies can deviate from the approved rates subject to the approval of the Commissioner.

Q: Can you explain the responsibilities of the Property Rating Subcommittee of the Bureau?

A: The Property Rating Subcommittee is involved in the development of rates, rating plans and territories for the Bureau, including the Dwelling rates. Current companies that have representation on the Subcommittee include American Bankers Insurance Company of Florida, American Modern Home Insurance Company, Farmers Insurance Exchange, Foremost Insurance Company, Horace Mann Insurance Company, Nationwide Mutual Insurance Company, N.C. Farm Bureau Mutual Insurance Company, State Farm Mutual Automobile Insurance Company, Travelers Indemnity Company, USAA and Allstate Insurance Company. Allstate Insurance Company chairs the Subcommittee. All representatives on the Subcommittee are actuaries or have extensive experience in ratemaking.

Q: Please describe how the Property Rating Subcommittee was involved in this particular Filing.

A: The Property Rating Subcommittee has been involved in developing various aspects of the rate indication methodology that is used. In most ways the approach in this Filing is consistent with prior filings, but the Subcommittee made a concerted effort to change methodology in order to respond to positions, suggestions, statements and actions by the North Carolina Commissioner of Insurance and the North Carolina legislature. The Subcommittee analyzes the data that is prepared by Insurance Services Office ("ISO"). This includes premium, loss and expense data. The Subcommittee established the overall methodology and makes selections based on the data and the expertise provided by Rob

Curry of ISO, Paul Anderson of Milliman, Elizabeth Henderson of Aon Benfield, Robert Fox of Aon Benfield, Dr. James Vander Weide and Dr. David Appel of Milliman, all of whom are experts in their fields and have submitted prefiled testimony that is contained in the Filing. Ultimately the Subcommittee develops recommendations to the Property Committee and the Governing Committee as to rate levels that meet the statutory requirement that rates not be excessive, inadequate or unfairly discriminatory. Those Committees adopted the recommendations of the Subcommittee and made additional decisions regarding capping of indications as discussed below.

Q: Please describe the overall ratemaking methodology in the Filing.

A: Premiums should equal expected losses, plus expected expenses, and a margin for a fair and reasonable profit. In this Filing, the required base rate per policy is developed by adding the appropriate profit and contingencies to the estimated costs associated with the policy. The required base rate is then compared to the current base rate to determine the indicated rate change.

Q: How does the methodology account for the loss experience of all of the insurance companies and entities that write Dwelling insurance in North Carolina?

A: For purposes of Bureau rate filings, all of the loss data in the state is consolidated together to essentially assume a single insurance entity with the composite or aggregate loss, expense and exposure distribution of all companies writing this line of insurance. ISO aggregates the data that it receives directly from various insurers as well as the data compiled by other licensed statistical organizations. The experience of the North Carolina Insurance Underwriting Association (historically called the "Beach Plan") and the North Carolina Joint Underwriting Association (commonly called the "FAIR Plan") is also included. The latest year of available written premium used in the Filing is 2013. In 2013, the total written premium for the Fire portion of Dwelling policies was approximately $93 million. In 2013, the total premium for the Extended Coverage portion of Dwelling policies was approximately $122 million. These dollar amounts include both residual market mechanisms that write Dwelling policies.

Q: How are the expected losses determined?

A: This Filing uses the loss experience of five accident years from January 1, 2009 through December 31, 2013. Using five years is consistent with prior filings, North Carolina statutes, and generally accepted ratemaking practices. The losses, excluding hurricane and excess wind losses, are adjusted to the base class level ($500 deductible level) and loss development factors are applied. The loss development factors account for the fact that the final ultimate losses are oftentimes different than estimated early on. A factor for excess wind losses of 5.9% was determined based on historic experience and applied to each accident year for Extended Coverage. The excess wind factor was determined based on ISO's standard excess wind procedure. Under that procedure the long-term excess factor is the ratio of the long-term average of the excess loss ratios to the average of the

long-term normal loss ratios. Historical non-hurricane wind experience back to 1950 is considered.

Losses are also trended to reflect the change in costs. The Current Cost Index reflects this trend and is based on a Modified Consumer Price Index and the CoreLogic Residential Index. In determining the Current Amount Factor, the Subcommittee reviewed pure premium experience and determined that no additional loss trend adjustment would be applied. The trended losses and loss adjustment expenses are divided by the house years to determine the average trended loss cost. That cost is then converted to the trended base-class loss cost by dividing the average rating factor for each accident year. Ultimately the five years are each applied a weight. For the Fire portion of the policy accident year 2013, the most recent year for which data is available, is applied a weight of 30%. Accident year 2012 is applied a weight of 25%. Accident year 2011 is applied a weight of 20%. Accident year 2010 is applied a weight of 15%. Accident year 2009 is applied a weight of 10%. These weights are consistent with past filings. The use of differing weights is a longstanding procedure in the Fire analysis that is intended to reflect responsiveness to changes while incorporating multiple years of data. For the Extended Coverage analysis, all five accident years are applied an equal weight of 20%. This is consistent with past filings and is based on the concept that Extended Coverage perils are weather related and thus more random. In connection with modeled hurricane losses, trending was performed by Aon Benfield based on factors provided by ISO (which were based on the selections made by the Subcommittee), and the resulting modeled hurricane losses including trend and loss adjustment expense were provided to ISO.

Q: How is hurricane exposure reflected?

A. Hurricane losses are so extreme and so volatile that for many years the accepted and uniform actuarial procedure for determining prospective hurricane losses is through the use of hurricane models rather than past hurricane losses. The Bureau began doing so in 1993 using the AIR model, and that model was used uniformly and exclusively by the Bureau in all property filings until this Dwelling Filing. In this Dwelling Filing, the Subcommittee reviewed the positions and statements of the North Carolina Commissioner of Insurance and the legislation enacted by the North Carolina legislature requiring the use of more than one hurricane model in Bureau property rate filings that are made after October 1, 2017. The Subcommittee determined that in this Filing the Bureau would employ two models even though that law is not yet applicable. The Subcommittee reviewed which models are most commonly relied upon by insurers, reinsurers and other parties and found that AIR and RMS are the two most widely used. The Subcommittee selected RMS to be the second model. In determining prospective hurricane losses in the Filing, the Subcommittee made certain to use models approved by the rigorous review process of the Florida Commission on Hurricane Loss Methodology. That Commission has examined hurricane models in great detail and approves only those that meet their rigorous standards. The Subcommittee also concluded that the soundest and fairest approach to the use of two models is to blend those models by computing the averages of the loss costs of the two models. During the course of working with Aon

Benfield regarding reinsurance, it was determined that Aon Benfield was able both to supply model results as well as to average and blend the results from the two models. Those blended results from the AIR standard catalogue and the RMS long term model are employed to determine the prospective hurricane losses on page C-3 of the Filing. As will be discussed further below, the AIR warm sea surface temperature catalogue and the RMS medium term models are employed in the analysis of the net cost of reinsurance factor in the Filing.

Q: How is the expense data compiled and reviewed?

A: The Bureau conducts special expense data calls annually. Companies complete the special expense call, which includes reporting expense dollars as well as premiums at collected level and adjusted to manual level. The Bureau checks and compiles this information for all companies and sends it to ISO to include in the Filing.

Commissions and brokerage, taxes, licenses, and fees are a function of written premium. The ratios for these expenses from the North Carolina special calls from 2012 to 2014, the most recently available calls, were used. The three-year average was selected. For Commissions & Brokerages, the selection was 11.0% for Fire and 9.8% for Extended Coverage. In both instances, the selection is within 0.7% of each individual year. For Taxes, Licenses and Fees, the selection was 2.8% for Fire and 2.5% for Extended Coverage. The selection is within 0.2% of each individual year. General and other acquisition expenses are determined based on a ratio to earned premium at manual level. The North Carolina special calls from 2012 to 2014 were also used. The three-year average was selected. The selected General Expense was 4.7% for Fire and 4.5% for Extended Coverage. The selected Other Acquisition Expense was 6.6% for Fire and 7.6% for Extended Coverage. These selections are then adjusted by ISO to reflect trend.

The loss adjustment expenses, both allocated and unallocated, are included with the losses in calculating the indication. Similar to the other expenses, the Subcommittee reviewed the data from the Bureau's data calls. Experience from calendar years 2010 through 2014 were reviewed. The ratio of loss adjustment expenses to incurred losses was analyzed. Consistent with past filings, the highest and lowest years were removed. This allows for more stability due to the variable nature of incurred losses. The selected loss adjustment expense was 8.6% for Dwelling Fire and 9.7% for Extended Coverage. The loss adjustment expense provision for hurricane losses was based upon data from Aon Benfield and was selected to be +6.0%.

The Subcommittee reviewed expense index trends, including the All items CPI Index (both with and without Energy) and the Total Compensation Cost Index – Insurance Carriers, Agent Brokers and Service from the Bureau of Labor Statistics. These measures varied from 1.80% to 2.43% based on different time periods. Based on the review, the Subcommittee selected a 2.0% expense trend. This factor was then used to trend expense dollars from the midpoint of the base period (July 1, 2010) to the midpoint of the trend period (July 1, 2015).

Q: Did the Subcommittee consider the profit provision?

A: Yes. Like past filings, the Subcommittee picked a conservative underwriting profit provision. Dr. Vander Weide provided a range for the current cost of capital based on three methods. The range varied from 8.6% on net worth using a Risk Premium Analysis to 12.2% using a Discounted Cash Flow methodology for the S&P 500. The range of cost of capital estimates provided by Dr. Vander Weide was found to be reasonable and accepted by the Subcommittee.

The committee selected an underwriting profit provision of 10.5% of premium. Based on Dr. Appel's analysis, this would generate a statutory return of 7.7% on net worth for Fire and 6.6% for Extended Coverage. This is significantly below Dr. Vander Weide's lower bound of 8.6%. It is the statutory return that should be considered when determining the underwriting profit in North Carolina because it does not take into account investment income on capital and surplus, so clearly the Subcommittee is being very conservative with our selection. Even if the 10.5% underwriting profit is combined with both investment income from insurance operations and investment income from capital and surplus, the estimated return on net worth is 9.9% for Fire and 9.1% for Extended Coverage. These are still well within Dr. Vander Weide's range, and thus the selected underwriting profit provision cannot be excessive.

Q: Did the Subcommittee consider a contingency provision?

A: Yes, the Subcommittee chose to reflect a 1% contingency provision. This is consistent with past filings and is common across the country. The contingency provision reflects the systematic bias that causes actual losses to be higher than reflected in the rates. There are multiple reasons for the bias.

Sources of this systematic bias in property insurance include, but are not limited to, judicial decisions that extend policy coverage beyond what was anticipated in the rates, legislative changes, and regulatory delay or reduction of rate filings and other factors.

Rate filings are generally not approved prior to their intended effective date or for more than requested. Courts rarely restrict coverage to less than intended in the policy forms and frequently expand coverage beyond what was intended. In addition, major unexpected losses can come from large and infrequent events of a type and magnitude that are not reflected in the experience period.

Thus, estimated premium that does not reflect a provision for these contingencies will fall short of needed premium very frequently. When these premiums are inadequate and underwriting losses are observed, an insurer must borrow from surplus to properly indemnify its policyholders or claimants. According to Actuarial Standard of Practice #30, the actuary should include a contingency provision if the assumptions used in the ratemaking process produce cost estimates that are not expected to equal average actual costs, and if this difference cannot be eliminated by changes in other components of the ratemaking process. The Subcommittee believes that a contingency provision is

appropriate and necessary, and it has conservatively selected a 1% factor in this Filing, the same as with all recent property insurance filings.

Q: Has the risk of a residual market assessment been considered in the Filing?

A: Yes. The residual market for property insurance in North Carolina is very large. The residual market consists of two mechanisms that have been set up by the North Carolina legislature to write policies in situations where the voluntary market is unable or unwilling to write at the rates available to it. In all 100 counties Dwelling policies can be written by the residual market mechanisms. For non-coastal areas that mechanism is known as the FAIR Plan. In the 18 coastal counties, Dwelling policies can be written by a separate residual market mechanism commonly known as the Beach Plan. The companies that voluntarily write property insurance in North Carolina are vulnerable to situations where large hurricanes cause losses that exceed the surplus and reinsurance of the residual market mechanisms. In such cases, there will be a non-recoupable assessment of up to $1 billion on the voluntary insurers writing property insurance in the state. This potential residual market assessment is a legislatively imposed cost of doing business in the state and is a condition for writing Dwelling insurance. The voluntary companies need to have and retain capital in order to contemplate these potential assessments. The Subcommittee reviewed an analysis done by Dr. Appel on the compensation for this assessment risk. The analysis is explained in the testimony of Dr. Appel. Based on this analysis the Subcommittee determined that a 3.6% factor is appropriate to reflect in the Filing. It is important to note that the assessment percentage would be higher if the exposure for the voluntary market companies was potentially greater than $1 billion.

Q: Was the cost of reinsurance considered in the Filing?

A: Yes. There are numerous scenarios where the potential losses due to a single hurricane are far greater than the entire premium collected by all the companies for the entire state of North Carolina. In order to remain viable long-term, the industry must purchase reinsurance. The costs associated with the reinsurance are costs of doing business in the state.

Q: What is reinsurance?

A: Simply, reinsurance is insurance for insurers. When insurers are aware of situations in which the potential losses are greater than the company is willing or able to tolerate, they purchase reinsurance or catastrophe bonds to mitigate those situations. Essentially the insurers will use a portion of the premium to purchase reinsurance. This is common across the industry, including at Allstate.

Q: How are the reinsurance costs reflected in the Filing?

A: The costs of reinsurance are incorporated through the work of Aon Benfield, based on Aon Benfield's extensive data and experience relating to reinsurance transactions. Aon

Benfield is the largest reinsurer in the world. Aon Benfield advised the Subcommittee as to the parameters of the reinsurance program for the hypothetical one company for which rates are being made in the Filing and then calculated the net cost of that reinsurance based on Aon Benfield's extensive data and experience. The parameters included the attachment and exhaustion points, the placement percentage and the inclusion of one reinstatement. The parameters were determined to essentially reflect the amount the amount of reinsurance that the hypothetical one company would purchase to protect its solvency in the optimal manner. Consistent with Aon Benfield's extensive experience and advice, the Subcommittee recommended the use of AIR's warm sea surface temperature event set and RMS' medium term model as the bases for determining the provision for reinsurance costs. Reinsurers, primary insurers and other parties customarily use such models to determine reinsurance rates. The results from those two models were averaged by Aon Benfield, and the blended average results were used in the calculation of the net cost of reinsurance displayed on page C-3 of the Filing.

Q: Why were actual reinsurance costs not used?

A: It is necessary to include the costs in the manner described above because it is not possible to incorporate the actual reinsurance costs of the various insurance companies. The approximately 65 individual insurance companies have different contracts that affect different lines, state combinations and perils. Some reinsurance contracts may be specific to North Carolina; others may apply to several states or even the entire country. It is not feasible to determine the reinsurance costs specific to North Carolina and specific to the line of Dwelling insurance in each individual contract. It is important to note that the calculation of the net cost of reinsurance in this Filing should relate exclusively to the costs in North Carolina. It is not appropriate for North Carolina insureds to assume the reinsurance costs of exposures in other states, and vice-versa. Some reinsurance contracts may be specific to the hurricane peril, while others may involve all types of wind perils including tornados. Some reinsurance contracts include numerous perils such as earthquake or terrorism. Some reinsurance contracts may be specific to homeowners, while others may include auto or commercial property losses. All of these complexities make it impossible to use the actual reinsurance costs.

Q: Have dividends to policyholders been considered in the Filing?

A: Yes. According to the Statement of Principles Regarding Property and Casualty Insurance Company Ratemaking, the rates should contemplate the cost of policyholder dividends. The Subcommittee determined that dividends have been negligible in recent years, and therefore chose to include a factor of zero with this Filing.

Q: Have deviations been considered in the Filing?

A: Yes. Deviations, or savings, are a cost of doing business in North Carolina for the insurers that have them approved. They are a cost of the risk transfer and therefore need to be contemplated according to the Statement of Principles Regarding Property and Casualty Insurance Company Ratemaking. Companies are required to reflect their

approved deviations. If rates are set without contemplating them, the industry would not achieve the profit provision included in the rates. The Subcommittee reviewed the net reduction in manual premium from deviations, consent to rate and Beach Plan surcharges for the years 2009 through 2013. The Subcommittee chose to include the average of the five years in the Filing. The selected deviation for the Fire portion of the Filing is 3.95%. The selected deviation for the Extended Coverage portion is 1.10%.

Q: What would happen if deviations were not considered?

A: The removal of deviations would limit the competitive marketplace in North Carolina. Deviations allow for companies to better attract and retain policyholders that they believe best fit their specific business model. If the overall deviations were not considered in the indication, it would lead to rate overall inadequacy. This could cause companies to pursue removing their deviations and ultimately leave them less well positioned to attract and retain their target policyholders. This and other issues relating to rate adequacy could lead to companies ultimately choosing not to do business in North Carolina.

Q: Are the data in the Filing reliable and accurate for ratemaking purposes?

A. Yes. The data underlying the Filing are reliable, accurate and appropriate for ratemaking. Individual insurance companies employ extensive procedures to assure the quality and reliability of ratemaking data used in the Filing. When individual companies submit their data to their statistical agents, the statistical agents review the data for possible errors and compliance with approved statistical plans. If an error is suspected, the statistical agents ask the company to review the data and to correct the data if necessary.

When ISO consolidates premium, loss and expense data from the statistical agents, it reviews the accuracy of the data and similarly requests that the data be reviewed and corrected if errors are suspected. These data include data for business written at or below the Bureau manual rates, business written under consent to rate procedures and business written in the residual market. When the Bureau assembles expense data and furnishes it to ISO, there are checks to determine the data's accuracy. Sometimes, if it is not feasible for a company to correct its data, that company's data is excluded from the Filing and that fact is noted in the Filing.

An additional check is that the Bureau requested the statistical agents to produce exhibits for the 10 largest writers displaying exposure distributions for key factors (such as territory, amount of insurance and protection class) for the years in the Filing. Each such company was asked to review and evaluate the accuracy of its data as reported to its statistical agent. Companies have confirmed that they have performed these reviews and that to the best of their knowledge their data are correct in all material respects. These companies constitute approximately 75% of the premium volume.

Q. Are changes in the territory definitions contained in the Filing?

A. Yes. The changes contained in the Filing for the Dwelling line comport with territory definitions that have been approved for the Homeowners line.

Q. Are the filed territorial rates the indicated rates?

A. No. In consideration of customer impacts, the Governing Committee directed that overall territorial impacts not exceed +35%. Therefore, the overall rate level proposed is +19.6% versus the indicated +27.2%.

Q. Do you have an opinion as to whether the indicated rate level changes in the Filing are excessive, inadequate or unfairly discriminatory?

A. Yes.

Q. What is that opinion?

A. First, let me note that I have relied upon the accuracy of the data supplied by the statistical agents and the Bureau. I have also relied on analyses performed by Aon Benfield, Dr. Appel and Dr. Vander Weide and on the work of Paul Anderson. With these qualifications, it is my opinion that the indicated rates are actuarially sound and meet the legal standard of producing rates that not excessive, inadequate or unfairly discriminatory. I qualify my opinion as it relates to the filed rates by noting that those rates have been developed by applying territory caps to the indicated rates. The filed rates are a reasonable step toward an adequate level.

Q. Does this conclude your prefiled testimony?

A. Yes.

PREFILED TESTIMONY
OF
ELIZABETH HENDERSON

2016 DWELLING RATE FILING BY
THE NORTH CAROLINA RATE BUREAU

Q. Please state your full name and business address for the record.

A. My name is Elizabeth Ann Henderson. My business address is Aon Benfield, 200 East Randolph Street, 11th Floor, Chicago, Illinois 60601.

Q. What is your involvement in this matter?

A. Aon Benfield has been retained by North Carolina Rate Bureau (NCRB) to provide expertise and analysis with respect to the expected hurricane losses and the net cost of reinsurance utilized in the 2016 NCRB Dwelling rate filing, and I head the team providing the analysis of the expected hurricane losses.

Q. Who is your employer and what are your primary duties for that employer?

A. I am employed by Aon Benfield, the world's largest reinsurance brokerage firm, and I am a Managing Director of the Catastrophe Risk Analytics group. I lead a catastrophe risk management team, consisting of 27 catastrophe modeling professionals, engineers, and meteorologists. I am responsible for

providing catastrophe modeling support for reinsurance placements and expected hurricane losses and am charged with positioning my team as a key differentiator in client solutions including support for multi-model analyses, benchmark pricing, data quality peer comparisons, model evaluation, real-time event response, portfolio optimization, catastrophe cost allocations, and rating agency questionnaire support. In effect, we assist our clients in all aspects of managing their exposure to catastrophe risk.

Q. Describe your professional and educational background.

A. I have been with Aon Benfield for 13 years since graduating from Northwestern University with Bachelor of Arts degrees in Mathematics and Philosophy. In my role at Aon Benfield I have participated in and lead the modeling efforts for reinsurance treaty placements on behalf of Aon Benfield's clients. My specializations include providing risk management consulting and catastrophe modeling services to United States property and casualty insurance companies, particularly in personal lines property, small commercial property and worker's compensation. I have worked directly with companies to help them analyze the amount of risk due to catastrophes to which they are exposing their capital and compare that risk to their risk tolerances.

Q. What models were utilized for these purposes?

A. In assessing their catastrophe risk, we utilize three different modeling firms: Risk Management Solutions (RMS), Applied Insurance Risk (AIR), and Impact Forecasting Elements (Impact Forecasting is a wholly owned subsidiary of Aon Benfield). We provide detailed analyses of the model results to enable companies to make business decisions around catastrophe risk management, including setting underwriting guidelines, developing rate indications, determining the appropriate amount of reinsurance to purchase and deploying growth capacity.

Q. Describe your early career at Aon Benfield.

A. I began working at Aon Benfield 13 years ago as a Catastrophe Risk Analyst. During my tenure at Aon Benfield I have worked within the Catastrophe Risk Analytics Group and have been promoted through five positions (Analyst, Senior Analyst, Associate Director, Director, and now Managing Director). My responsibilities grew with each new job as I expanded my capabilities. When I began my career as an Analyst, I was responsible for the day-to-day modeling for a variety of client accounts. This included processing and profiling raw client data into model-specific import files, importing client data into the models of AIR and RMS, setting up and executing model runs in AIR and RMS, and pulling out results and building exhibits. I was responsible for ensuring the accuracy of my work, and reporting back to my clients about their results and how those results impacted their reinsurance treaties. In my early career I spent most of my time

working within the models' framework and learning how different types of insurance terms are handled in each model, how to properly code client data for the most accurate results and how to interpret the manner in which portfolio changes and model changes impact results.

Q. How has your career progressed and changed over time?

A. In my current role at Aon Benfield I am responsible for the work output of a team of 27 Catastrophe Risk Analysts serving 64 clients. My job has three distinct areas of responsibility. First, I am responsible to my clients; I work directly with clients on specialized projects such as reviewing how their internal coding process impacts model results and making recommendations on refining their data to produce more accurate loss estimates. I help clients identify their profitable business opportunities and build a plan with regular monitoring to achieve the clients' growth plans. In addition to working directly on client projects, I meet regularly with my team to discuss and review other active client projects to ensure that we are delivering best in class analytics to all of our clients. My second responsibility is to my team. I am a mentor and a coach to all 27 members of my team, and I take steps every day to align individual performance goals with business and client needs. My third responsibility is to the business unit. I help to set the strategic priorities of the Catastrophe Analytics team within the context of the overall goals of Aon Benfield.

Q. Describe the role of Aon Benfield Analytics.

A. Aon Benfield Analytics provides consultative services to clients of Aon Benfield who sell primary insurance coverage and assists those insurers in the assessment of the risk of catastrophe loss to their portfolio and in the placement of reinsurance treaties to address that risk of catastrophe loss. The main areas of services to Aon Benfield clients include: catastrophe modeling; catastrophe insurance ratemaking assistance; actuarial services (e.g., range of loss and expense estimation, enterprise risk management, reinsurance analysis, capital analysis); rating agency modeling and analysis; insurance and reinsurance accounting; and tax and finance related modeling and assistance.

Q. Describe the role of the Catastrophe Risk Analytics group.

A. The Catastrophe Risk Analytics group is a part of Aon Benfield Analytics. The role of this group is to provide clients of Aon Benfield with analytics involving the management of catastrophe risk and how it relates to their reinsurance purchasing decisions. We provide clients with analyses of their catastrophe risk and develop their understanding around different model views for their portfolio. We help our clients develop a management view of their catastrophe risk against which they can evaluate reinsurance purchasing decisions.

Q. Describe your experience with catastrophe models.

A. Beginning 13 years ago in my role as a Catastrophe Risk Analyst I have used multiple models to evaluate catastrophe risk for my clients. My daily work requires me to be able to interpret and transform client data into appropriate "model-ready" files. I determine how to properly input the client data into the different models. I have prepared data and run analyses in the models RMS RiskLink, AIR Touchstone, Impact Forecasting Elements, and CoreLogic RQE, and have pulled and analyzed loss output from those models. I have observed and reviewed changes in the models during my tenure at Aon Benfield. I use the output of the models (such as PMLs, AALs, Layer Expected Losses and Historical Loss projections) to help clients identify the exposures at risk to a catastrophe at various confidence intervals. Clients compare those loss projections to their internal risk thresholds to determine how much reinsurance they need to protect their earnings and capital. The same models are also used by primary insurers and reinsurers to evaluate portfolios and determine an appropriate price for risk transfer and are used in catastrophe bond transactions.

Q. Describe your experience with catastrophe reinsurance.

A. Aon Benfield is the world's largest reinsurance brokerage. My role as a catastrophe risk analyst means that I am directly involved with our clients who are seeking to purchase catastrophe reinsurance. Output from our modeling is

used by our brokers, clients and capital markets to determine AAL's and the appropriate amount of reinsurance to purchase and what the appropriate fair market price for that reinsurance should be.

Q. Do you speak on topics pertaining to catastrophe modeling?

A. Yes. I speak annually at the Aon Benfield Analytics Client Conference on various topics related to catastrophe modeling. That conference is routinely attended by primary insurers, reinsurers, regulatory agencies, and modeling firms.

Q. What was Aon Benfield's role in this filing with respect to expected hurricane losses?

We provided advice to the NCRB regarding how to input the exposure data it provided, how to run the AIR and RMS models consistently based on that exposure data, how to assure that the model output is correct and how to blend the results of the two models in the manner utilized in the marketplace by Aon Benfield's clients.

Q. Did the NCRB ask Aon Benfield to run the AIR and RMS models?

A. Yes. We ran the models of AIR Touchstone and RMS RiskLink. These are the most commonly relied upon hurricane catastrophe models in the industry and we run these two models on all of our clients' data, regardless of whether or not either model is used by the client to set rates. Our view is that it is important to understand the two primary views of risk that exist in the industry. These two models are routinely relied upon by reinsurers in pricing catastrophe risk and by primary insurers in determining anticipated hurricane losses. More than half of our clients use two models when evaluating their catastrophe risk and blend those results, as opposed to relying only on one model for management decisions. Of those that utilize two models, the vast majority blend the results evenly, taking a straight average. We have used the same approach for the NCRB to determine the appropriate modeled hurricane losses to use in the rate filing. Our general recommendation to the NCRB and to other clients is to use a straight average when calculating a blend of the results. This means that we run the individual models and determine the appropriate allocation of reinsurance and loss costs independently for each model. Then we average the two results to determine the blend. The vast majority of our clients, who do blend, use this method. One reason is due to the ease of understanding and auditing the results. Models change frequently in different ways, and it is important for people making business decisions based on those models to be able to track those changes. By first determining the losses from RMS and AIR independently, you can gain insight into how each model interprets the risk differently. It is an approach that involves an insurer's access to detailed information from both

models and then uses a blended metric to make purchasing decisions and allocate costs.

Q. Is it customary to run multiple models to determine catastrophe risk for your clients?

A. Yes. At Aon Benfield we believe it is important to understand the various views of catastrophe risk that exist about any particular client's portfolio. In a reinsurance transaction, multiple parties must agree upon the cost to transfer the risk. Our clients need to understand how the market will be interpreting their catastrophe risk; therefore, it is important for them to understand how various models interpret their portfolios.

Q. Is it common that modeled losses will differ between the various model vendors?

A. Yes. There is a degree of uncertainty, both up and down, in predicting losses from catastrophes. That is a natural consequence of the substantial volatility associated with the occurrence of relatively infrequent and rare events. While all modeling firms start with relatively similar meteorological and insurance data inputs, such as information on past storm characteristics and claims data from insurance companies, there are differences between modelers in their approaches to interpreting and supplementing this data to build a robust model.

The process of developing the models brings with it a degree of uncertainty in the results, although there is no inherent upward or downward bias in this degree of uncertainty. Modelers must take the known meteorological data from actual storms and employ standard statistical techniques to distribute that limited data to create a distribution of storms that may happen in the future. This is why models can take similar input and come up with different answers. The spread between two views of the same risk helps companies understand the uncertainty inherent in these models. Through blending of the results of multiple models, clients can better manage their catastrophe risks despite variation between model results. Given the number of variables involved in the development of a catastrophe model and the degree of uncertainty associated with each variable, it would be unexpected and atypical if two independently derived models resulted in the same output or conclusions on a given set of data.

Q. How do the models change over time?

A. Over time modelers utilize advanced research and loss analyses to enhance their methodology, applying the most recent and relevant scientific understanding to their models. New research into past events, updates to building practices and codes, insight from engineering experiments and findings as to claims experience from recent events are among the many different types of information that are used to inform how the modelers make updates to their models. Each

modeling firm takes a different approach to how frequently it updates its models and how it prioritizes the schedule by which perils and regions will be updated.

Q. Do modeled losses change as updated data is entered into the models?

A. Yes. As noted above, the models are reliant on many sources of data. Data on past storms and updated building code data, for example, will be used by modeling firms as inputs into developing their model. For the insurer, changes in the coverage and the underlying policies-in-force will change the model output. Also, changes in an insurer's portfolio composition, i.e. where they write new policies and the geographic concentration of their exposures over time will change the results of the models.

Q. How do the models differ in their event rate calculations?

A. RMS and AIR have different methodologies for their event rate calculations. AIR bases their event sets on groups of simulated years. They offer 10,000, 50,000, and 100,000 year event sets. A simulated year contains a set of events that take place for that given year. Every event is assigned the same probability in the AIR event set. This probability is equal to 1 divided by the number of years in the event set. For NCRB we used the 100,000 event set, and therefore the rate for each event was 0.00001. RMS does not use yearly simulations, rather they assign specific probabilities to each event independently. The sum of the

rates for all of the events will equal RMS's view of hurricane risk for any given year. For example, if the sum of all Category 1 hurricanes rates is 0.5, one Category 1 would be expected to affect the area of interest every 2 years. To compare this to AIR rates, one would sum the 0.00001 for all Category 1 events in AIR's event set.

Q. How do clients typically account for variation in the model losses between different models?

A. It has become increasingly common for companies to use two models. As I said, more` than half of our clients use two models when evaluating their catastrophe risk, blending those results. Of those that utilize two models, the vast majority blend the results evenly, taking a straight average, as has been done for the NCRB in this filing. The percentage of clients that blend models to build a management view of risk has grown substantially in recent years. In my opinion, this has been driven by large loss experience, most specifically from hurricanes, that demonstrate the degree of uncertainty around any single selection, as well as what I will call model change volatility. The blending of two models produces less volatile and more reliable results over the long term than the use of a single model.

Clients are also exposed to volatility related to model change. When the models make changes to their underlying assumptions around frequency, hazard, and vulnerability, clients will see their catastrophe loss estimates change. Because the modeling firms make updates on different schedules, and often interpret and apply new research in different ways, it results in a changing risk management environment. Using a blended view will smooth out some of that model change volatility over time.

Q. Let's talk further about the work Aon Benfield performed for the NCRB for this Dwelling rate filing. Can you describe the client data that was employed as input for the model runs?

A. The data we employed was provided to us by the NCRB. My understanding is that the data had been compiled on behalf of the NCRB by Insurance Services Office (ISO). The NCRB advised us that the data consisted of the aggregate exposure information for all dwelling risks in North Carolina, including those written by the companies and those written by the residual market (which in North Carolina is the NCIUA, or Beach Plan, and the NCJUA, or Fair Plan). In effect, the NCRB asked us to run the models using the aggregate data as if there were a single company writing all of the dwelling insurance in North Carolina.

Q. Please describe what Aon Benfield then did with the data provided by NCRB.

A. As is customary in our work, we reviewed the data received from the NCRB for completeness and reasonableness before we input it into the AIR and RMS models. Since the two models have different formats for inputting data, we worked with the NCRB to assure that the exposure data was properly and consistently entered in the required format for each model. We are accustomed to this procedure because we have to do the same thing for the many individual companies that we represent.

The next step was to input the data and run the models. We ran the AIR Standard model and the RMS Historical model for the purpose of determining the modeled hurricane losses. We ran the AIR WSST model and the RMS Medium Term Rate model for the purpose of analyzing the cost of reinsurance against our extensive reinsurance market data, which is what we always do in assisting our clients with their reinsurance placements. In my experience, it is standard practice throughout the industry to rely upon the models we used to determine modeled hurricane losses and in reinsurance placements.

After the models were run, we reviewed each model's output individually to be sure that the output resulted from a consistent entry of the same exposure data. We again followed the same procedure for assuring data quality that we follow for all of our clients. Then we blended the results of the two models, taking a straight average of the results as I described earlier. We again reviewed the blended results to assure that the blending procedures were correctly performed

and that the blended results were correct. Once we were satisfied that the results were correct, we provided the blended modeled hurricane losses to the NCRB for use in its dwelling rate review. At the NCRB's request, we also provided the results to Milliman for its use in the work it was doing as part of the NCRB's dwelling rate review. Exhibit RB-6 sets forth the blended modeled hurricane losses resulting from the work I have described. Based on my knowledge and experience and the input data provided by the NCRB, these modeled hurricane losses are reasonable and appropriate projections of expected hurricane losses for use by the NCRB in its dwelling rate review and rate filing.

Also, we employed these blended results as part of our work determining and allocating the cost of reinsurance. My colleague, Robert Fox, led our analysis of the net cost of reinsurance, and his testimony is also included in this filing. I assisted with that work and, from my perspective the procedures that we followed were consistent with our standard business practices in assisting our clients with their reinsurance placements and produced results that are reasonable, sound and reliable.

Q. Does that conclude your testimony?

A. Yes.

North Carolina Rate Bureau
Gross Modeled Hurricane Expected Losses including Cat LAE and Trend

Territory	Modeled Expected Losses
110	19,477,739
120	22,484,405

Total	80,658,556

Modeled hurricane expected losses for North Carolina Rate Bureau, net of limits and deductibles. Results include demand surge and exclude storm surge. Losses represent 50/50 blend of AIRv3.1 100k Standard event set and RMSv15 Historical event set. Results also include 6% Cat LAE and 9.9% trend factor.

EXHIBIT RB-7

PRE-FILED DIRECT TESTIMONY OF ROBERT C. FOX

2016 DWELLING INSURANCE RATE FILING
by the
NORTH CAROLINA RATE BUREAU

Q. Please state your full name and business address for the record.

A. My name is Robert Charles Fox. My business address is Aon Benfield, 200 East Randolph Street, 11th Floor, Chicago, Illinois 60601.

Q. What is your involvement in this matter?

A. My employer, Aon Benfield, has been retained by North Carolina Rate Bureau (NCRB) to provide expertise and analysis with respect to the expected hurricane losses and net cost of reinsurance utilized in the NCRB's 2016 Dwelling Insurance rate filing. I am part of the team at Aon Benfield that has performed those services.

Q. You indicated that you are employed by Aon Benfield. Who is Aon Benfield and what are your primary duties for that employer?

A. Aon Benfield is the world's largest reinsurance brokerage firm. I am Managing Director of the Catastrophe Actuarial practice group within Risk and Capital Strategy, a division of Aon Benfield Analytics. My primary responsibility is to assist insurance company clients of Aon Benfield in the areas of pricing and managing catastrophe risk.

The clients I work with buy some of the largest reinsurance programs in the world and many of these programs are exposed to hurricane risk along the Atlantic and Gulf coasts of the United States.

Q. Describe the role of Aon Benfield Analytics.

A. Aon Benfield Analytics is a division of Aon Benfield, and it provides consultative services to reinsurance clients of Aon Benfield. The main areas of services to Aon Benfield clients include: catastrophe modeling; catastrophe rate making assistance; actuarial services; rating agency modeling and analysis; insurance and reinsurance accounting; and tax and finance related modeling and assistance.

Q. Describe the role of the Catastrophe Actuarial practice group.

A. The role of this group is to provide clients of Aon Benfield with analytics and related support involving the pricing and management of catastrophe risk. We provide estimates and allocations of expected catastrophe costs for use in accounting, ratemaking, strategic planning, profit sharing, and production incentives. These catastrophe costs are expected average annual losses, the net cost of reinsurance, and cost of capital required to support retained catastrophe risk.

Q. What is catastrophe reinsurance, who buys it, and why do they buy it?

A. Reinsurance is insurance for insurance companies. An insurer that provides insurance to another insurer is called a reinsurer. The policy the reinsurer issues

reflecting the agreement to assume risks from the original policy issuing insurer is referred to as a reinsurance treaty or a reinsurance contract. It is typically purchased in layers of coverage, with each layer attaching where the prior layer exhausts.

While much of the risk an insurer assumes by writing insurance policies, house fires for example, can be diversified by writing multiple policies, this increases the insurer's exposure to natural catastrophes. Because catastrophe risk can threaten the solvency of an insurer and impair its ability to pay the claims of its policyholders, insurers with significant property exposure will secure catastrophe reinsurance through traditional reinsurance treaties or catastrophe bonds. This reinsurance transfers catastrophe risk from individual insurers to the global reinsurance market, thereby protecting the solvency of the insurance industry and helping to ensure that all policyholder claims will be paid at a lower cost than maintaining surplus sufficient to retain the risk.

Q. Describe your professional and educational background.

A. I have been employed as an actuary for twenty-six years, all of that time devoted to the actuarial science called ratemaking. During thirteen of those twenty-six years I was employed at Nationwide Insurance, where I developed rate filings for Homeowners and Auto, researched and improved ratemaking methodologies, and developed spreadsheets to implement those methodologies.

I was hired by Aon Benfield (then Aon Re) in 2005 to build a team dedicated to providing its primary insurance company clients with analytics based on catastrophe model output and expertise related to the pricing of catastrophe risk.

I graduated from Wheaton College in 1990 and received a bachelor of sciences degree in mathematics. I am an associate of the Casualty Actuarial Society and a member of the American Academy of Actuaries. I have satisfied the continuing education requirements of and am in good standing with those organizations.

Q. Describe your experience with hurricane models.

A. I have utilized hurricane model output in ratemaking since the mid-1990's as my employer was an early adopter of hurricane modeling and I was involved in the evaluation and implementation of our first model. Prior to that time, I and many other actuaries were relying on various procedures based on historical hurricane loss data. Computerized models became available in the 1990's and became the state of the art by the late 1990's. Today, computer hurricane models are widely accepted as the best way of determining expected hurricane losses for ratemaking purposes.

Since joining Aon Benfield in 2005, I have used catastrophe model output heavily in my daily work for our insurance company clients. The models I have used most heavily are those for the perils of hurricane, earthquake and fire following, convective storm, and wildfire in the United States. I am personally responsible for our compliance with Actuarial Standard of Practice 38—Use of Models Outside the Actuary's Area of Expertise (ASOP 38), and actuaries at a number of clients of Aon Benfield state full or partial reliance on me as having performed the steps required by the standard. I have advised over 100 insurance companies on incorporating the results of catastrophe

models into primary insurance rates, with many of these having significant exposure to hurricane risk.

Client rate filings require allocating modeled loss costs to legal entity or business unit, line of business, policy form, and geographic unit. For filing purposes the most common geographic unit is rating territory, but finer detail is often provided and allows for evaluation of territory definitions. I also assist clients in incorporating model results appropriately in statewide indications and relativity analyses, either up front or by reviewing a filing prior to submission. Once a filing is submitted, I am heavily involved in helping clients respond to regulator questions regarding catastrophe models.

Q. Describe your experience with catastrophe reinsurance.

A. I have incorporated reinsurance costs into rate filings since the late 1990's. Since joining Aon Benfield in 2005, I have analyzed thousands of catastrophe reinsurance layers in my daily work for Aon Benfield's insurance company clients. My work involves determining reinsurance costs for client rate filings, advising clients on the rate implications of various reinsurance structures, and developing strategic plans with executive management of client insurers.

Similar to my answer on modeled loss costs above, client rate filings require allocating catastrophe reinsurance costs to legal entity or business unit, line of business, policy form, and geographic unit. For filing purposes the most common geographic unit again is rating territory, but finer detail is often provided and allows for evaluation of territory definitions. I also assist clients in incorporating reinsurance costs appropriately in

statewide indications and relativity analyses, either up front or by reviewing a filing prior to submission. Once a filing is submitted, I am heavily involved in helping clients respond to regulator questions regarding reinsurance costs.

I am frequently involved in evaluating and communicating the primary insurance rate impacts of various reinsurance structures. Since this involves multiple divisions of a primary insurer, these conversations typically involve more senior management. Evaluating rate impacts involves modeling and estimating rates-on-line for various reinsurance structures as well as their impact on required capital. Because reinsurance and capital costs involve different cost drivers, these costs are sometimes allocated to state and line of business level for a more detailed analysis of rate impacts.

Strategic planning involves the most detailed analysis and collaboration with the highest levels of client management. These projects often involve multiple representatives, some of whom may be a vice president, president, chief actuary, CFO, COO, or CEO depending on the size of the company. This analysis involves allocating all costs associated with catastrophe risk, expected losses, reinsurance costs, and capital costs, down to the individual policy or location level, adding provisions for non-modeled catastrophe and non-catastrophe losses, and expenses, and comparing to policy premiums. The results are mapped and aggregated along various dimensions to identify segments for rate action and/or growth. Multiple scenarios are evaluated for their impact on rate adequacy and some measure of portfolio size. The size of the portfolio may be measured in premium, insured values, or policy counts, depending on the goals of the client.

Q. Do you speak on topics pertaining to insurance, catastrophe modeling, and/or catastrophe reinsurance?

A. Yes. I speak frequently on ratemaking for catastrophe risk, catastrophe risk management, and strategic planning for property insurance lines. All of these involve applications of catastrophe model output and reinsurance costs. In addition to speaking at Aon Benfield's annual Analytics Conference every year since 2006, I have spoken at meetings of the Casualty Actuarial Society (CAS), the Southeastern Regulators Association (SERA), the Southern California Casualty Actuarial Club (SCCAC), the Alabama Governor's Affordable Home Insurance Commission (AHIC), South Carolina's Coastal Property Task Force, and the Milliman Conference for Chief Actuaries. In addition, I have held educational meetings or less formal discussions on these topics with regulators in Alabama, California, South Carolina, Massachusetts, and Mississippi.

Q. Have you testified in other jurisdictions regarding catastrophe modeling or reinsurance?

A. Yes, I have testified in Florida regarding the use of hurricane models in ratemaking and incorporation of the net cost of reinsurance in actuarially sound rates. I have also testified in California regarding the use of wildfire and fire following earthquake models and the net cost of reinsurance in ratemaking.

Q. What was your role in this filing with respect to expected hurricane losses?

I provided advice to NCRB regarding best practices for estimating expected hurricane losses for ratemaking based on my experience advising primary company clients, communications with regulators in several states, and an annual review of hundreds of rate filings by me and my staff.

Q. Are catastrophe simulation models commonly used by insurers for ratemaking in catastrophe-exposed lines and jurisdictions?

A. Yes, catastrophe models, especially those modeling hurricane and earthquake risk, have become the standard method of estimating catastrophe risk in rate filings. In fact, the use of a certified hurricane model is required by law in Florida, the most hurricane-prone state.

Q. What is meant by the term, "certified," in your response?

A. The Florida legislature in 1995 created the Florida Commission on Hurricane Loss Projection Methodology (FCHLPM) to review both the public and trade secret information underlying submitted models and determine whether or not to certify each model as "accurate and reliable for ratemaking." The Commission is comprised of the Florida Insurance Consumer Advocate, the Chief Operating Officer of the Florida Hurricane Catastrophe Fund (FHCF), The Executive Director of the Citizens Property Insurance Corporation, the Director of the Florida Division of Emergency Management, the actuary member of the FHCF Advisory Council, an employee of the Office of Insurance Regulation who is an actuary responsible for property insurance rate filings, five members appointed by the state's Chief Financial Officer (an industry actuary, a

state university finance expert with a background in actuarial science, a state university statistics expert with a background in insurance, a state university expert in computer system design, and a state university expert in meteorology who specializes in hurricanes), and a licensed professional structural engineer who is a full-time faculty member in the state university system and who has expertise in wind mitigation techniques. The Commission is supported by a panel of additional experts who conduct on-site reviews of each model at the headquarters of the firm submitting the model. The professional team consists of actuaries, meteorologists, computer scientists, statisticians, hydrologists, structural engineers, and a coastal engineer.

I have personally attended several meetings of the FCHLPM and am convinced that the Commission's review of hurricane models is the most rigorous and thorough review possible outside of the reviews conducted internally by the modeling firms themselves.

Q. How is this certification in Florida relevant to ratemaking in North Carolina?

A. Many state regulators, including those in South Carolina, Alabama, Louisiana, and Texas, look to Florida's Commission to determine whether or not to accept a particular model for ratemaking because it is the only public entity that thoroughly examines hurricane models to determine their suitability for use in ratemaking. Most aspects of the Commission's review are as applicable to North Carolina as they are to Florida.

Q. Are the hurricane models used in the Rate Bureau's Dwelling Insurance rate filing to estimate expected hurricane losses certified by the Florida Commission?

A. Yes, the AIR Hurricane Model for the United States, Version 15.0.1, as implemented in Touchstone 3.1, was certified by the FCHLPM on October 14, 2015 as “accurate and reliable for projecting hurricane loss costs and probable maximum loss levels for residential property in Florida.” AIR has had a certified model in Florida continuously since 1996.

The RMS North Atlantic Hurricane Model Version 15.0.1 was certified by the FCHLPM on January 20, 2016 as “accurate and reliable for projecting hurricane loss costs and probable maximum loss levels for residential property in Florida.” RMS has had a certified model in Florida continuously since 1997.

Both current certifications expire on November 1, 2017, by which point both firms are expected to have updated models accepted by the Commission.

Q. What level of credibility is typically assigned to the blended results of catastrophe simulation models in ratemaking?

A. It is industry standard practice that, if multiple models are used, the blended results of the models are considered 100% credible.

Q. What does that mean?

A. Credibility is a relative measure, which depends not only on the credence an insurer places in the model output, but also on the availability of other potential estimates of expected catastrophe losses. Since catastrophe models incorporate all known

information pertaining to catastrophe risk, there is no other data that would improve the estimate of expected catastrophe losses if it were used to complement the model output. Catastrophe models produce estimates that involve a significant amount of uncertainty, but model uncertainty is significantly less than the uncertainty involved in any other approach. Catastrophe models are by far the best tool available to insurers to estimate their exposure to catastrophe risk.

Q. Is it increasingly common for companies to use multiple models in rate filings?

A. Yes. For a variety of practical reasons, some companies continue to use only one model. All companies filing property insurance rates in Florida use a single model because the Office of Insurance Regulation (OIR) there prohibits the use of multiple models for ratemaking. However, I always recommend the use of at least two models.

Q. Why does the Florida Office of Insurance Regulation prohibit the use of multiple models for ratemaking?

A. Florida statutes require that companies use “a” model accepted by the FCHLPM in rate filings. The OIR has interpreted this language to mean that companies must use “one and only one” model. This conclusion is best understood as a legal interpretation rather than an actuarial opinion. When the statutes were revised in 2014 to accommodate private flood coverage, they were written to specifically permit the use in rate filings of a straight average of the results from multiple flood models.

Q. What advice do you give clients of Aon Benfield regarding the use of multiple models versus a single model?

A. As I said earlier, I always recommend a multi-model approach using at least two models, weighting the models equally. Not only are you not overly beholden to the assumptions of a particular model, but you also temper any swings that might occur when a vendor updates a model.

Q. Did the Rate Bureau seek your advice on the use of multiple models versus a single model?

A. No. The Rate Bureau had already decided to use two models when it contacted Aon Benfield about its assistance with this Dwelling insurance rate review.

Furthermore, the Rate Bureau indicated in our initial discussions that it desired to use the AIR and RMS models that I identified earlier. I was already very familiar with those models and was very comfortable with the idea of the Rate Bureau using them.

Q. Would you please explain why or how it is that you were already familiar with the AIR and RMS models?

A. At Aon Benfield, we use these models on a daily basis in our work, and I have spent a great deal of time familiarizing myself with these models. As I mentioned earlier, I am personally responsible within our team for our compliance with ASOP 38, and I have

performed the necessary reviews of the AIR and RMS models required by that standard.

Q. What types of events are included in the AIR and RMS hurricane models?

A. I've spent a lot of time researching this question, as it comes up frequently in conversations with clients. The simple answer is that the models include hurricanes but not tropical storms, but that answer isn't as simple as it sounds. Consider Gabrielle (2001), which made landfall south of Tampa as a tropical storm but became a hurricane after crossing the state and heading back out to sea. Isidore (2002) was a hurricane in the Gulf, but weakened to tropical storm strength before making landfall near New Orleans. Cindy (2005) was classified as a tropical storm at the time of the event, but was later reclassified as a hurricane. Sandy (2012) produced hurricane winds over the US before finally making landfall as a tropical storm. All of these events are considered hurricanes by the National Hurricane Center because they were hurricane strength at some point in their existence.

We prepared a list of these events and others and sent them to both AIR and RMS to determine whether or not they considered these modeled hurricane events. Based on their responses and some subsequent conversation, we concluded that for an event to be considered a modeled hurricane event for their US models, both firms require that the event produced hurricane-force winds over the US. Of the events mentioned above, Cindy and Sandy were the only modeled hurricane events.

Q. Why is the designation of an event important?

A. Any event that is not addressed by the model needs to be reflected in a provision for non-modeled losses in a rate filing. The responses from the modelers were consistent with the way Property Claim Services (PCS) designates events. Any event assigned a catastrophe code by PCS is also assigned a cause of loss. If that cause of loss is "hurricane," all losses associated with the event should be removed from traditional ratemaking approaches as they are addressed by the hurricane model.

Q. How should hurricanes be addressed that lose strength to tropical storm level or even lower before reaching North Carolina?

A. The goal is to have all expected losses addressed somewhere but none double-counted. The most common approach from an individual company perspective is to remove from historical experience all losses from events that are assigned a hurricane-designated PCS catastrophe code, since these events are the same as those the modeling firms consider modeled hurricane events. Unfortunately, PCS codes are not utilized by all companies reporting data to the Rate Bureau, so when aggregating industry data ISO must use a more complicated approach.

Q. Have you reviewed the approach taken by ISO to remove hurricane losses from the historical experience?

A. Yes, I have.

Q. Do you believe based on your review that the ISO approach is reasonable?

A. Yes. Given the data available to the Rate Bureau and ISO, I think the approach produces a reasonable complement to modeled hurricane losses. I see no reason to believe that any hurricane losses might be double-counted, even for lower wind speeds far out from the eye of the hurricane or associated with hurricanes that have weakened but are still causing damage.

Q. What is demand surge?

A. Demand surge represents the increase in the cost of labor and materials needed to repair damaged property following a significant natural catastrophe event. This increase has been observed following such very large events and it is a natural result of the increased demand for labor and materials in those situations. As a result, the models incorporate it into their loss estimates.

Q. Which applications of catastrophe model output typically reflect demand surge?

A. All applications of catastrophe model output should reflect demand surge. There is no reason to underestimate the impact of large events by ignoring the increase in demand for labor and materials as a result of those events. In our experience, all companies run the models with demand surge. In fact, the only times we ever run a model without demand surge at Aon Benfield are to measure the impact of demand surge for testing purposes and where specifically requested, such as for the South Carolina Department of Insurance, which requires that the impact of demand surge be

separately displayed in filing forms. Here, the Rate Bureau requested that we also run the models without demand surge so that it could provide certain statutory information in the filing.

Q. Does South Carolina or any other state prohibit the inclusion of demand surge in modeled losses for rate filings?

A. No. South Carolina asks for the impact of demand surge in filing forms, but doesn't prohibit its inclusion in expected losses. I'm not aware of any prohibitions against the use of demand surge in rate filings. In fact, the Florida Commission standards actually require that certified models incorporate demand surge based on relevant data and actuarially sound methods and assumptions.

Q. North Carolina has laws prohibiting "price gouging" following a hurricane. Doesn't that eliminate demand surge?

A. No. Florida has a similar law. Demand surge can and does occur due to supply and demand economics in situations that would not be considered price gouging and/or that would not be prevented by statutes prohibiting price gouging.

Q. Does it make sense for North Carolina hurricane losses to include demand surge for very large events impacting other states even if those events were less significant in North Carolina?

A. It does. Labor and materials can and do move freely across state lines, so demand surge is a regional, rather than a state-specific, phenomenon.

Q. The models contain simulated hurricane events that produce Category 5 wind speeds over North Carolina, even though North Carolina has not experienced Category 5 wind speeds in the recorded experience. Should those events be excluded from the models for ratemaking purposes?

A. No, that would not be appropriate. The meteorologists and other experts who have created the models have determined that it is appropriate to include simulated hurricane events that produce Category 5 wind speeds over North Carolina, and it is not appropriate for me as an actuary to interpose my judgment over that of those experts and to adjust the model in that manner unless I have evidence indicating that such an adjustment should be made. As I described earlier, I have performed a detailed review of both the AIR and RMS models and I am not aware of any evidence indicating that such an adjustment of the models would be reasonable or appropriate. Further, it would not be reasonable or appropriate to exclude individual simulated events from the model results simply because they are rare or large. Doing so would improperly bias the results downward without justification.

Q. Is it reasonable that rare simulated hurricane events should have a significant impact on expected average annual losses?

A. Absolutely. This is the nature of skew distributions like that of hurricane activity. Looking at the history of PCS hurricane events in North Carolina, two events account for

over 60% of losses in today's dollars. Two events over the 66-year history of PCS means that 60% of losses came from 3% of the years tracked by PCS. Almost 80% of historical losses come from three events or 4.5% of the years. It is reasonable and expected that rare events will have a significant impact on expected average annual losses.

Q. Earlier you mentioned that the projected losses produced by the catastrophe models may involve a significant amount of uncertainty. Does that uncertainty mean that it is appropriate to discount the losses produced by the models?

A. No. Uncertainty is an inherent part of modeling, but the uncertainty in these models means that the resulting modeled losses could be too low or too high. Unless one has clear and reliable evidence that a model's results are higher than they should be, the uncertainty that exists in catastrophe models is not a reasonable or appropriate basis upon which to discount those model results.

Q. Are you aware of how the reinsurance program was designed for purposes of this rate filing?

A. Yes, I am. Our team reviewed the actual reinsurance programs of our client companies writing property insurance in the Southeast, including North Carolina, that are currently in force. We set the attachment and exhaustion points of the proposed reinsurance program at the average attachment and exhaustion points of those actual programs. We then sent this information to Aon Benfield brokers actually working with companies in the reinsurance market and requested input as to how the various layers

of reinsurance would be structured in the current marketplace. Based on the guidance received from those brokers, the reinsurance layers between the attachment and exhaustion points were determined. We then presented our proposed reinsurance structure to the Rate Bureau, and the Rate Bureau approved it. This reinsurance structure, as recommended by Aon Benfield and approved by the Rate Bureau, is shown in Exhibit RB-7A accompanying this testimony.

Q. Do you believe the reinsurance structure selected by the Rate Bureau is reasonable?

A. Yes. The approach taken by the Rate Bureau is consistent with other elements of the rate filing. There is an inherent trade-off between reinsurance and required capital. Any risk that an insurer cedes to reinsurers is a risk that the insurer does not have to fund with capital. Any risk retained must be funded with capital that requires a return, or profit.

For ease of incorporation into the remainder of the filing, we designed the reinsurance structure for 2017. This simply means that the modeled event losses used to design and price the reinsurance program were trended to 2017 for all purposes related to the provision for net cost of reinsurance.

Q. Why does the reinsurance program consider perils other than hurricane?

Peril-specific reinsurance towers are rare, so the program was designed on an all-perils basis. The Dwelling insurance policies contemplated in the Rate Bureau filing are

exposed to not only hurricane losses, but also convective storm (tornado and hail) losses, and fire following earthquake losses, so the program is consistent with what the aggregate one company assumed by the Rate Bureau would purchase. The filing does not include the reinsurance costs for perils other than hurricane, and therefore includes only the portion of the costs we developed that pertain to the hurricane peril. Our all-perils approach accurately reflects the way reinsurance programs are designed and purchased in the reinsurance market, and the portion of the costs we developed and identified for the Rate Bureau as pertaining to the hurricane peril reasonably and accurately reflect the costs of the hurricane portion of the reinsurance program.

Q. Why doesn't the reinsurance structure consider other lines of business or other states?

At the request of the Rate Bureau for consistency with the remainder of the filing and with prior year's filings, the reinsurance structure assumes that only Dwelling insurance for North Carolina is covered by the treaty. Insurers purchase a wide range of catastrophe reinsurance structures, with layers covering anything from a single state and peril to a countrywide or even global layer covering all perils. If the Rate Bureau were to depart from consistency with the remainder of the filing with respect to its North Carolina-only approach, there is no alternative reinsurance structure that would be more appropriate for all insurers writing Dwelling insurance in the state.

It is also important to note that there is no diversification benefit (and no reduction in cost) to be gained by writing other property lines such as Homeowners or Commercial

Property. These just represent more exposure in the same place and would increase reinsurance cost.

There is also little diversification benefit to reinsurance rates from writing in multiple states, even geographically diverse states. Financial theory says that investors aren't willing to pay extra for the stock of a diversified firm because they can diversify more cheaply themselves. This same thinking applies to reinsurers. A company with a diversified book doesn't pay less for reinsurance because the reinsurer can diversify the book more cheaply than the insurer.

A company with a well-diversified book can save reinsurance premium by sharing the layers they buy across multiple geographies. However, this savings comes from buying less reinsurance and not by paying reduced rates, and it comes with an increase in risk. For example, a typical reinsurance layer covering North Carolina would include one reinstatement of the coverage limit so that North Carolina insurers would have reinsurance coverage for two North Carolina events. If the layer were made to cover Texas as well, and Texas generated a reinsurance recovery, North Carolina would be left with reinsurance coverage for only one event. If Texas experienced two significant events, North Carolina would have no reinsurance coverage at all.

Q. How was the reinsurance premium estimated?

A. We used two approaches. First, we used our Technical Pricing Model, which is a proprietary model of reinsurance market prices that we maintain. Being the largest reinsurance broker provides us the opportunity to build a regression of reinsurance

market rates-on-line based on insurer modeled expected losses and volatility in each layer by peril and catastrophe model vendor. This regression is refreshed twice a year following each renewal period and provides the most rigorous estimate of reinsurance pricing for the risk ceded. Relevant to the discussion above regarding the assumption of a single state reinsurance program, the Technical Pricing Model reflects that North Carolina hurricane risk is somewhat diversifying against the peak Florida hurricane risk of the reinsurance market. This regression takes a significant amount of time to complete, so the most recent results are as of January 1, 2016, with treaties expiring December 31, 2016.

The second approach is to analyze the relationship between loss-on-line and rate-on-line for the most recent renewal period for regional insurers with Atlantic coast but no Florida exposure. This approach is less technical, but uses more current information. In a changing market, this can be useful.

The results of the two approaches describe above were similar, so we selected a straight average of rates-on-line derived from each as shown in Exhibit RB-7B. Before finalizing our recommendation to the Rate Bureau, we requested a review of our results from some of the more experienced brokers in our office, and they agreed that our rates-on-line were reasonable.

Q. Are reinsurance rates regulated the way primary rates are?

A. No they are not. Market rates are determined in a free market which is very competitive. Both parties are knowledgeable and sophisticated regarding the risk

transfer, and the buyer typically has the support of and representation by a broker to strengthen their position.

Q. How was the reinsurance premium allocated?

A. We allocated the reinsurance premium to peril and territory using an algorithm derived from our Technical Pricing Model as shown in Exhibit RB-7D. Designed to replicate the way the reinsurance market prices risk, the model breaks down reinsurance premiums into three drivers: weighted ceded losses by peril, a capacity charge allocated on a quantity we call Internal Correlated Standard Deviation, and reinsurer cost of capital, allocated on External Correlated Standard Deviation.

For lower layers, expected ceded loss is the primary driver of reinsurance premiums so the allocation is based mostly on ceded losses (81.12% for Layer 1). Expected ceded losses are weighted by regression-derived coefficients that reflect the reinsurance market's view of model miss and potentially a charge for volatility of non-hurricane perils. The allocation of the ceded loss driver is based on the contribution of each peril and territory to expected reinsurance recoverables.

The capacity charge is similar to a minimum premium on the primary side. Reinsurers must collect something to cover expenses and risk, even if the models say the risk is negligible. This component becomes more dominant for higher reinsurance layers where the number of simulated events reaching the layer decreases and the rate-on-line approaches a minimum.

The allocation of the capacity charge component is intuitive. The segments of the business that drive the need for capacity pay more of the capacity charge. Our goal therefore is to allocate the capacity charge to those perils and territories that see the greatest reductions in volatility of expected losses as a result of the placement of each layer. Mathematically, we multiply the standard deviation of the losses ceded to the layer by the correlation between each policy and the remainder of the company (or Rate Bureau) portfolio. We call this quantity Internal Correlated Standard Deviation because the correlation is internal to the insurance company. From the policyholder perspective, if a policy is in a territory that drives the need for reinsurance, it will pay a bigger share of the capacity charge than a policy that is in a territory that is unlikely to benefit from the reinsurance being purchased.

Hurricane volatility drives the amount of capital reinsurers need to hold. Higher reinsurance layers involve transferring more hurricane volatility, so reinsurer cost of capital increases for higher reinsurance layers. Five years ago reinsurer cost of capital would have dominated the higher layers of a hurricane exposed treaty, but this component is no longer as significant due to the increase in the supply of capital to the reinsurance market. For this filing, reinsurer cost of capital drives only 11.33% of the allocation of the reinsurance cost for the top layer.

As it was with the capacity charge, the allocation of reinsurance capital is intuitive. This component is allocated based on the contribution of each peril and territory to expected industry hurricane loss volatility. Mathematically, we multiply the standard deviation of the losses ceded to the layer by the correlation between each policy and an industry loss portfolio, which serves as a proxy for the reinsurance market. We call this quantity

External Correlated Standard Deviation because the correlation is external to the insurance company. From the policyholder perspective, if a policy is in a territory that drives industry hurricane risk, it will pay a bigger share of the reinsurer capital cost than a policy that is in a lower risk territory.

Q. How was the net cost of reinsurance calculated?

A. The net cost of reinsurance can be thought of simply as the reinsurance premium less expected ceded losses recoverable. However, there are two adjustments that need to be considered.

First, the reinsurance program assumes that the industry standard of one reinstatement of the limit applies. The cost to reinstate the limit is paid for as an automatic reduction to ceded losses otherwise recoverable following an event. If we ignore this, we will understate the net cost of reinsurance by overstating ceded losses recoverable.

Second, reinsurance treaties typically cover loss adjustment expenses (LAE) that can be allocated to a catastrophe event. Assuming a 6% ratio of “catastrophe LAE” to catastrophe loss, we adjust all modeled loss events by a factor of 1.06 prior to simulation to avoid double-counting LAE associated with catastrophe events. The factor of 1.06 was selected based on a review of LAE factors applied to catastrophe losses in AM Best SRQ submissions of Aon Benfield Clients as shown in Exhibit RB-7C.

Finally, by simulating thousands of years of events, we determine the expected ceded losses and catastrophe LAE by layer as well as an expected reinstatement premium.

Then the net cost of reinsurance is simply deposit premium plus expected reinstatement premium less expected ceded losses and catastrophe LAE recoverable.

For purposes of the NCRB Dwelling Insurance filing, the reinsurance costs are utilized only for the hurricane peril. For hurricane, expected premiums are $104,713,410, expected recoverables are $30,684,314, and the net cost of reinsurance is $74,029,096. These results were allocated to territory as reflected in Exhibit RB-7E and provided to the Rate Bureau for use in this filing.

Q. Are you aware of the work performed by Dr. Appel for this and prior NCRB rate filings?

A. Yes, I am.

Q. Given your experience in catastrophe reinsurance, do you find his approach to be reasonable?

A. Yes. Our approach is based on detailed information on current reinsurance market rates and underlying model output. Dr. Appel doesn’t have direct access to that information, but had instead designed a reinsurance program based at least in part on guidance provided to him several years ago by Aon Benfield. The dramatic reduction in reinsurance costs over the past five years has led to some increases in the amount of reinsurance purchased, so we provided updated information on current attachment and exhaustion return periods in the Southeastern United States. For this filing Dr. Appel

has adjusted his treaty structure to be on an apples-to-apples basis with our analysis, and then proceeded with his prior approach as usual.

Dr. Appel's approach to pricing the reinsurance layer could be described as the exact opposite of ours. We built a model tying actual observed reinsurance market rates to client model output metrics, and then applied the model to NCRB data. Dr. Appel instead takes the perspective of the reinsurer. Given various assumptions for items such as expenses and required surplus, he estimates the rate that would be required to achieve a reasonable rate of return to the reinsurer. I have not evaluated the individual assumptions that underlie Dr. Appel's analysis, but his approach produced an expected reinsurance premium and net cost that are similar to the results of our analysis.

Q. Do you know whether the Rate Bureau has used in the Dwelling filing the Aon Benfield net cost of reinsurance results you provided?

A. Yes, I am advised that the Rate Bureau has used in the filing both our statewide results and those results allocated down to the territory level.

Q. Do you have an opinion regarding the appropriateness of the net cost of reinsurance provision incorporated into the Dwelling filing?

A. Yes. Based on my experience with hurricane models and using modeled hurricane losses and my experience with catastrophe reinsurance and determining catastrophe reinsurance costs for rate filings, it is my opinion that the provision for the net cost of

reinsurance in the filing, at the statewide and territory levels, is reasonable and appropriate.

Q. Does that conclude your testimony?

A. Yes.

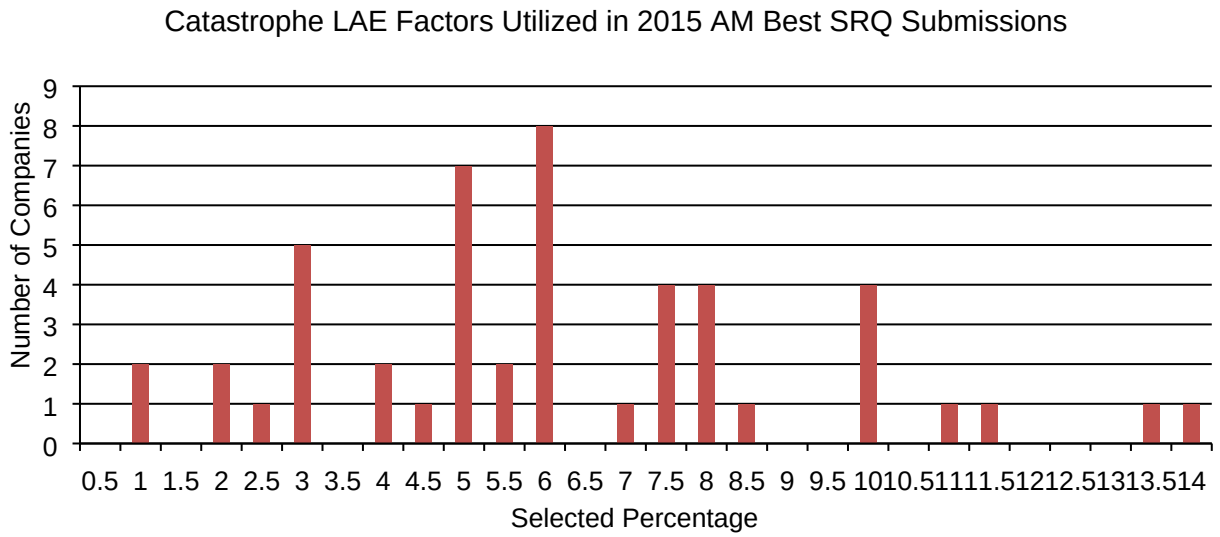
150M xs 350M	11.66	11.15	11.40

The table above shows indicated rates-on-line for the filing's reinsurance structure. We have selected a straight average of the more rigorous Technical Pricing approach and the more current Loss-On-Line approach. The two methods produced similar indications.

North Carolina Rate Bureau
Support for Selected Catastrophe LAE Factor



This chart shows Catastrophe LAE factors applied to modeled catastrophe event losses in AM Best SRQ Submissions by Aon Benfield clients in 2015.

- Factors were rounded to the nearest 0.5
- Hurricane was used where factors varied by peril
- Multiple factors were counted where factors varied by company within a group
- Includes all clients that incorporated a provision for LAE

The straight average factor is 6.2, while the median and mode are both 6.0, so we recommended, and the Rate Bureau selected, a factor of 1.06.

PREFILED TESTIMONY
OF
PAUL D. ANDERSON

2016 DWELLING INSURANCE FILING BY THE
NORTH CAROLINA RATE BUREAU

Q. Please state your name and business address.

A. My name is Paul D. Anderson. My business address is 15800 West Bluemound Road, Brookfield, WI 53005.

Q. By whom are you employed?

A. I am employed by Milliman, Inc. (Milliman) and have been employed by Milliman since February 1, 2007.

Q. What is your educational background?

A. I received a Bachelor of Science in Actuarial Science from Drake University in Des Moines, Iowa in 1993.

Q. Do you have any additional certifications or qualifications?

A. Yes. I have been a Fellow of the Casualty Actuarial Society since 2002. Since then, I have participated on several committees of the organization. I was on the Examination Committee of the Casualty Actuarial Society between 2004 and 2006. I served on the Volunteer Support Task Force from February 2012 until April 2013. I have been a member of the Volunteer Resources Committee since April 2013. I have also been a member of the American Academy of Actuaries since 2002, and meet all of the continuing education requirements.

Q. What is your employment background?

A. I was employed by Allstate Insurance Company from June 1993 until January 2007. While at Allstate, I held various actuarial roles. I began my career as an Auto Pricing Analyst and continued to assume increasing responsibility in various departments that included Property Pricing, Auto Pricing, Property Research, and Auto Research. On the pricing teams, I assisted in developing rates for property and auto insurance products in most states across the country. On the research teams, I assisted in developing new property and auto risk classification plans to be implemented by Allstate's pricing teams. From 2006 until January 2007, I served as a Senior Manager for Allstate's Eastern region,

which included assisting in the oversight of the pricing strategies for approximately half the country, including North Carolina.

In February 2007 I began my career at Milliman. Since 2007 I have completed, managed, or overseen numerous property and auto pricing analyses for a variety of clients. My clients have included small single-state insurance companies, industry-leading national insurance companies, government entities, the North Carolina Rate Bureau, and other entities with similar coastal property exposure in states such as Florida and Texas. These client assignments have included such projects as pricing analyses to evaluate overall rate adequacy, predictive modeling assignments to develop new risk classification plans, and analyses of catastrophe losses to evaluate the adequacy and allocation of property premiums corresponding to catastrophe risk.

Q. What is Milliman?

A. Milliman is among the world's largest independent actuarial and consulting firms. Milliman was founded in Seattle in 1947 as Milliman & Robertson and today has offices in principal cities worldwide, covering markets in North America, Latin America, Europe, Asia and the Pacific, the Middle East, and Africa. Milliman employs more than 3,200 people, including actuaries and specialists ranging from clinicians to economists. The firm has consulting practices in employee benefits, financial services, healthcare, life insurance, and property and casualty insurance. Milliman serves the full spectrum of business, education, financial, governmental, union, and nonprofit organizations.

Q. What are your current responsibilities at Milliman?

A. I am responsible for managing and overseeing the personal lines and insurance-related predictive analytics portion of Milliman's Milwaukee Casualty practice. The personal lines and predictive analytics team conducts a variety of property and auto pricing and predictive modeling assignments, primarily for insurance companies. Over the last three years, we have completed property analyses for nearly every state in the country, including North Carolina.

Q. Were you engaged to provide actuarial services to the North Carolina Rate Bureau (the Rate Bureau) in relation to its 2016 dwelling rate filing?

A. Yes, I was.

Q. What was the scope of that engagement?

A. Milliman was engaged for several aspects of the 2016 dwelling rate filing. Dr. David Appel of Milliman's New York office was engaged to review the Underwriting Profit provision, the Net Cost of Reinsurance provision, and the Compensation for Assessment Risk provision in this filing. The Rate Bureau also engaged ISO to provide an analysis of

the historical rate-level indication data, including an analysis of loss development, loss and premium trends, expenses, excess loss factor, and the average deviation. My role was to conduct an independent review and provide feedback on the actuarial analyses underlying the filing. In this role, I participated in many of the discussions in which ISO presented the preliminary data to the Rate Bureau. In addition, my role also included participating in the Rate Bureau's Property Rating Subcommittee meetings in which the 2016 dwelling filing was discussed. During these discussions, I offered feedback and insights to assist in the subcommittee's selections and decisions related to this filing.

Q. Is your firm being compensated for this engagement?

A. Yes, it is.

Q. Is that compensation in any way contingent on the provision of favorable testimony in support of the proposed filing?

A. No, it is not.

Q. Have you completed your review of the 2016 dwelling rate filing?

A. Yes, I have.

Q. Were there any constraints placed on your review, such as limited or delayed access to data or limited time that may have hindered your complete review?

A. No, I was provided all the data and information that were necessary and I had adequate time for a complete review. My review was not limited in any way.

Q. What is the overall indicated change in dwelling rates in this filing?

A. This filing shows the need for an overall 27.2% rate increase. This includes a -16.6% change to fire rates and a 48.6% change to extended coverage rates.

Q. Please describe the overall ratemaking methodology that underlies the filing.

A. The approach in this filing is generally consistent with prior dwelling filings submitted by the Rate Bureau. Consistent with the *Statement of Principles Regarding Property and Casualty Insurance Ratemaking* as published by the Casualty Actuarial Society, the indicated rates reflect the expected costs associated with issuing dwelling policies. These expected costs include claims, claim settlement expenses, operational and administrative expenses, and the cost of capital.

The statewide rate-level indications for dwelling policies are developed based on a loss cost methodology (instead of a loss ratio methodology). The indicated rate-level change

is calculated for each segment by comparing the required base rate per policy to the current base rate. The required base rate per policy is calculated by first projecting the losses and loss adjustment expenses for the policy period for which the filed rates are expected to be in effect. Base class loss costs are calculated by dividing the projected losses and loss adjustment expenses for each historical accident year by the corresponding earned house years and average rating factors. The base class loss costs by year are weighted together to develop a weighted trended base class loss cost. For the extended coverage portion of the filing, a modeled base class loss cost is also developed and added to the weighted trended base class loss cost to determine the total base class loss cost.

Following the development of the base class loss cost, other expected underwriting expenses associated with issuing dwelling insurance policies, as well as provisions for underwriting profit and contingencies, are incorporated to determine the required base rate per policy. As mentioned above, the required base rate per policy is compared to the current base rate to develop the overall statewide indicated rate-level change. This comparison of the required and current base rates is consistent with the *Statement of Principles* referenced above, is commonly used throughout the industry, and as such, is an actuarially sound method of developing an indicated rate-level change.

Q. Are there any changes in the ratemaking methodology compared to prior filings?

A. Yes. Although the 2016 dwelling filing is generally consistent with prior filings, there are several components of this filing that rely on different approaches as compared to prior dwelling filings. These revised approaches, which will be discussed in more detail later, include the blending of two hurricane models to derive the provisions related to expected hurricane losses and the retention of Aon Benfield to calculate the Net Cost of Reinsurance. These changes impact the modeled base class loss cost, the compensation for assessment risk, and the reinsurance cost per policy.

Q. How are the expected losses determined?

A. This filing uses five years of historical loss experience including accident years ending December 31, 2009 through December 31, 2013. Using five years of experience is consistent with North Carolina statutes and prior dwelling fire and extended coverage rate filings. It is also consistent with generally accepted ratemaking practices because the use of five years of experience balances stability of the overall rate level with responsiveness to the most recent conditions. Because severe weather-related events can cause volatility in the loss experience, hurricane and excess wind losses have been removed from the base loss experience. Each of the five years of losses have been developed to ultimate amounts and have been adjusted to a common $500 deductible level. Losses are developed to ultimate because the final incurred losses for an accident year are often different than initial loss estimates due to late-reporting claims or as yet unknown settlement amounts on known claims.

After these initial adjustments, a provision for loss adjustment expenses and a factor for excess wind losses are applied to each accident year. The excess loss factor of 1.059 for the extended coverage section of the filing is determined using ISO's standard excess wind procedure. This procedure evaluates historical non-hurricane wind experience back to 1950 to develop a ratio of the long-term average excess loss ratio to the long-term average normal loss ratio.

Following these additional adjustments, in order to reflect the expected change in costs, the losses are trended from the midpoint of each experience period to the midpoint of the trend period. Similar to prior dwelling filings, both external trend information and actual pure premium data are considered to select the loss trends. However, in this filing, no additional adjustments are made based on the review of actual pure premium data. In reviewing external trends, the CoreLogic residential index and the Modified Consumer Price Index are averaged together using an appropriate weight on each to develop the Current Cost Index. The Current Cost Index for each year is compared to the Current Cost Index for the trend period to determine Current Cost Factors for each accident year.

In addition to reflecting a loss trend, a premium trend is also determined by calculating Current Amount Factors for each accident year. The Current Amount Factors are developed by comparing the Average Policy Size Relativity for each year to the comparable relativity for the trend period. The ratio of the Current Cost Factor and the Current Amount Factor is calculated for each year in order to apply a net trend (i.e., the net difference between the loss trend and premium trend) to each year's adjusted incurred losses.

In my opinion, all of the selections referenced above, including the excess loss factor, the loss trend factors, and the premium trend factors, are reasonable and actuarially sound.

After adjusting the losses for each of the items mentioned above, each year's trended losses and loss adjustment expenses are divided by the earned house years to determine the average trended loss cost. The average trended loss costs are multiplied by a Composite Projection Factor, which reflects the combined impact of a loss projection factor and premium projection factor. This Composite Projection Factor adjusts the loss costs to the policy period for which the filed rates are expected to be in effect. Those loss costs are converted to Trended Base Class Loss Costs by dividing by the Average Rating Factor applicable to each accident year. Finally, these base loss costs are weighted together to develop a Weighted Trended Base Loss Cost. The weights applied to each accident year differ between fire and extended coverage because there tends to be more variation in the extended coverage loss costs as compared to the fire loss costs. As a result, to avoid giving too much weight to an unusually high or low loss cost, an even distribution of weights is applied to the historical experience for extended

coverage. In contrast to this, a distribution that assigns more weight to the more recent years is used for fire, since that segment typically has more stable base loss costs.

In my opinion, the methodology used to develop average loss costs and the different weights assigned to fire and extended coverage are reasonable and are consistent with widely-used actuarial ratemaking practices.

Q. In the previous response, you mentioned a loss adjustment expense provision. How are the dwelling provisions for loss adjustment expense determined?

A. The allocated and unallocated loss adjustment expenses are included with non-hurricane losses by applying a trended loss adjustment expense factor. Using information received from the Rate Bureau's data call for expense experience, loss adjustment expenses are summarized for calendar years 2010 through 2014. Consistent with the prior dwelling filing, a three-year average is calculated after removing the highest and lowest ratio of expenses to losses. By excluding the highest and lowest ratios observed in the historical experience period, this methodology reduces the volatility in the average loss adjustment expense ratio that may result from variation in the underlying incurred losses from year to year. After the average loss adjustment expense ratio is calculated, it is adjusted to reflect the difference in the loss adjustment expense trend and the loss trend.

A separate provision for hurricane-related loss adjustment expenses is included in the modeled hurricane losses based on data and a recommendation provided by Aon Benfield.

Q. In your opinion, are the provisions for loss adjustment expenses reasonable?

A. Yes, the loss adjustment expense provisions are reasonable. It is common practice in the industry to use an average of historical experience to determine a loss adjustment expense provision, and it is reasonable to adjust that provision for expected differences in the loss adjustment expense trend and the loss trend.

Q. Is credibility considered in the rate-level indication?

A. Yes, credibility is considered, but based on the volume of data supporting the statewide rate-level indications, both fire and extended coverage are considered fully credible. The full credibility standards are 500,000 house years for fire and 330,000 house years for extended coverage. When the territorial rate-level indications are calculated, partial credibility is determined using the square root rule, which is a long-standing actuarial methodology used throughout the industry.

Q. How is hurricane exposure reflected in the extended coverage section of the rate-level indication?

A. Similar to the Rate Bureau's prior dwelling filing, this filing reflects hurricane exposure in the extended coverage section of the rate-level indication by using modeled hurricane losses rather than actual hurricane loss experience. Although there are actual hurricane losses in the experience period, the hurricane and excess wind losses have been removed from the base loss experience, as noted in my comments above. Actual hurricane losses have a significant amount of variability even when evaluating twenty or more years of historical loss experience in a state. As such, it is universally accepted by the property and casualty insurance industry that hurricane models provide the most reliable basis of determining average annual hurricane losses over an extended time period. Hurricane models can be used to simulate 100,000 or more years of events, which provides a broader perspective on potential insured losses as compared to only evaluating the last several decades of losses. This broader perspective provides a more reliable estimate of the average frequency of insured hurricane losses. Similarly, it provides a more reliable estimate of the frequency (and severity) of very rare, but very severe events that may not have occurred within the last 100 years of recorded history, but have the potential to occur during a 100,000 year window of time.

Q. How is the provision for expected hurricane losses different than prior dwelling rate filings?

A. The provision for average annual hurricane losses in this filing differs from the prior dwelling filing in that expected hurricane losses were developed through the use of hurricane models of two independent catastrophe modelers as compared to using only one model in the prior filing. It is my understanding that, in all prior Rate Bureau filings containing a provision for modeled hurricane losses, the estimated hurricane losses were developed by AIR Worldwide (or its predecessor). With this filing, in addition to relying on AIR's hurricane model, the Rate Bureau also relied upon hurricane losses derived from the RMS (Risk Management Solutions) hurricane model. To facilitate the use of two hurricane models, the Rate Bureau retained Aon Benfield to run both models and to develop modeled hurricane losses using the blended results of these two models. I reviewed the exposure data provided as input to each model, and it is my opinion that the data was reasonable and consistent with other sections of this filing. I am also familiar with the assumptions selected as inputs to each model, and it is my opinion that the assumptions were applied consistently in both the AIR and RMS models such that the resulting output of both models are comparable. However, because Aon Benfield ran both models, I am relying on the work and opinions of Aon Benfield as it relates to specific details about the modeling process.

The Rate Bureau requested that Aon Benfield combine the results of the two hurricane models by averaging the results from each model. This approach of giving equal weight to each model is intuitive, easy to understand, and the most reasonable method of

blending two hurricane models. This blending approach (i.e., averaging) is also a common practice among other insurance companies that consider multiple hurricane models. Based on my review of the blended model results, it is my opinion that the resulting hurricane losses reflected in this filing are reasonable and can be relied upon for the various purposes for which modeled hurricane losses are used in this filing. Additionally, since both models are equally credible, it is also my opinion that assigning equal weight to each model is the most reliable blending method and the most actuarially sound manner to consider two hurricane models.

Q. What model versions and modeling assumptions were used to develop estimated hurricane losses?

A. The current AIR model is Touchstone v3.1 and the current RMS model is Risklink v15.0. To develop the expected hurricane losses, Aon Benfield relied on AIR's Standard event set and on RMS' Historical event set. These event sets were used instead of AIR's Warm Sea-Surface Temperature (WSST) event set and RMS' Medium-Term Rate event set. By using the Standard and Historical events sets, the estimated hurricane losses developed by Aon Benfield for both models are lower than would otherwise have been developed using the WSST and Medium-Term Rate event sets. Although many primary insurance companies consider the WSST and Medium-Term Rate events sets when developing indicated rates in states other than North Carolina, the event sets selected for this filing are reasonable and actuarially sound. Because the selection of the Standard and Historical event sets produces lower hurricane losses than would be developed by the use of the WSST and Medium-Term Rate event sets, this mitigates against any concern of excessive rates resulting from modeled hurricane losses.

Both the AIR and RMS models were run with aggregate demand surge included, which was identified as loss amplification in the RMS model. This standard procedure accounts for the expected additional cost for labor and materials after a very large hurricane occurs. Historical experience shows that when major catastrophic events occur, the increased demand for building materials, labor, temporary housing, and other basic necessities can exceed the supply of these same items, which consequently increases their cost. Running models with demand surge is consistent with the Rate Bureau's prior dwelling filing, and is the common practice by insurance companies that develop rates based on modeled hurricane losses. Although the demand surge component of each model was used in this filing, the storm surge component of each model was not used to develop hurricane losses.

Q. Were any other calculations applied to the hurricane losses derived from the models?

A. Yes. Before providing the blended hurricane losses, Aon Benfield trended the modeled hurricane losses and applied a hurricane-specific provision for loss adjustment expense. After Aon Benfield provided the trended modeled hurricane losses (including LAE), ISO

calculated a Modeled Base Class Loss Cost. The Modeled Base Class Loss Cost has been adjusted in a consistent manner as the Weighted Trended Base Class Loss Cost.

Q. How are the provisions for Commission and Brokerage determined?

A. The provisions for Commission and Brokerage are determined based on the three-year average of the ratio of each segment's Commission and Brokerage expense relative to each segment's Written Premium.

Q. In your opinion, are the provisions for Commission and Brokerage reasonable?

A. Yes, the Commission and Brokerage provisions are reasonable. It is common practice in the industry to use a three-year average to determine a Commission and Brokerage provision.

Q. How are the provisions for Taxes, Licenses, and Fees determined?

A. The provisions for Taxes, Licenses, and Fees are determined based on the three-year average of the ratio of each segment's Taxes, Licenses, and Fees expense relative to each segment's Written Premium.

Q. In your opinion, are the provisions for Taxes, Licenses, and Fees reasonable?

A. Yes, the Taxes, Licenses, and Fees provisions are reasonable. It is common practice in the industry to use a three-year average to determine a Taxes, Licenses, and Fees provision.

Q. How are the provisions for Other Acquisition expense determined?

A. The provisions for Other Acquisition expense are determined based on the three-year average of the ratio of each segment's Other Acquisition expense relative to each segment's Earned Premium. The three-year average provisions are then trended from the midpoint of the experience period to the midpoint of the trend period based on an expense trend derived from cost indices. Following this, the trended Other Acquisition expense provisions are added to the trended General Expense provisions and applied to the statewide average current base rates (adjusted for premium trend) to develop an average Fixed Expense per Policy for fire and for extended coverage.

Q. In your opinion, are the provisions for Other Acquisition expense reasonable?

A. Yes, the Other Acquisition expense provisions are reasonable. It is common practice in the industry to use a three-year average to determine an Other Acquisition expense provision, and to trend fixed expense provisions to account for inflation.

Q. How are the provisions for General Expense determined?

A. The provisions for General Expense are determined based on the three-year average of the ratio of each segment's General Expense relative to each segment's Earned Premium. The three-year average provisions are then trended from the midpoint of the experience period to the midpoint of the trend period based on an expense trend derived from cost indices. As noted above, the trended General Expense provisions are added to the trended Other Acquisition expense provisions and applied to the statewide average current base rates (adjusted for premium trend) to develop an average Fixed Expense per policy for fire and for extended coverage.

Q. In your opinion, are the provisions for General Expense reasonable?

A. Yes, the General Expense provisions are reasonable. It is common practice in the industry to use a three-year average to determine a General Expense provision, and to trend fixed expense provisions to account for inflation.

Q. Is a provision for Dividends included in the filing?

A. No, the Rate Bureau reviewed historical data and considered whether to apply a provision for Dividends, but elected not to include one in this filing.

Q. Is a Contingency provision included in the filing?

A. Yes, the Rate Bureau is including a 1% Contingency provision in this filing. This is consistent with the prior dwelling rate filings submitted by the Rate Bureau.

In addition to being consistent with the prior Rate Bureau filing, the use of a Contingency provision is common within the property and casualty insurance industry. According the *Actuarial Standard of Practice No. 30: Treatment of Profit and Contingency Provisions and the Cost of Capital in Property/Casualty Insurance Ratemaking,* "the actuary should include a contingency provision if the assumptions used in the ratemaking process produce cost estimates that are not expected to equal average actual costs, and if this difference cannot be eliminated by changes in other components of the ratemaking process." There are several reasons why expected cost estimates may not be equal to actual costs. Some of these reasons include adverse court decisions, extension of coverage for unforeseen or unintended exposures, regulatory delay or reduction in filed rate changes, and unexpected large losses not sufficiently recognized in the normal ratemaking process. Based on reasons such as those listed above, the Rate Bureau believes a Contingency provision is appropriate and necessary. It is my opinion that a 1% Contingency provision is reasonable, consistent with common actuarial practice, and appropriate based on fundamental actuarial principles.

Q. Are you providing expert testimony concerning the Underwriting Profit provision?

A. No, I am relying on the work and opinions of Dr. Vander Weide and Dr. Appel as to the Underwriting Profit provision. The scope of my analysis and testimony relates to other aspects of the proposed rate filing.

Q. Are you providing expert testimony concerning the Net Cost of Reinsurance provision?

A. No, I am relying on the work and opinion of Aon Benfield as to the Net Cost of Reinsurance provision. The scope of my analysis and testimony relates to other aspects of the proposed rate filing.

It is my understanding that in prior Rate Bureau filings, Dr. Appel has developed the Net Cost of Reinsurance provision. With this filing, Aon Benfield was engaged by the Rate Bureau to develop the Net Cost of Reinsurance provision based on their prominence with respect to the reinsurance industry, their ability to access relevant data and experience from the reinsurance market, and their expertise with catastrophe-related issues.

Q. Are you providing expert testimony concerning the Compensation for Assessment Risk provision?

A. No, although I assisted Dr. Appel with some of the underlying calculations for that provision, I am relying on the work and opinions of Dr. David Appel as to the Compensation for Assessment Risk provision. The scope of my analysis and testimony relates to other aspects of the proposed rate filing.

Q. Is a provision for Deviations included in the filing?

A. Yes, the Rate Bureau is including a 3.95% provision for Deviations in the fire rates and a 1.1% provision for Deviations in the extended coverage rates. This methodology is consistent with the prior dwelling rate filing submitted by the Rate Bureau.

In addition to being consistent with prior Rate Bureau filings, the use of a provision for Deviations is reasonable, appropriate, and actuarially sound. Deviations are up-front reductions to the manual rates that reflect savings for the policyholders. Deviations are filed by insurance companies and approved by the North Carolina Department of Insurance. The lower rates resulting from the approved deviations are used until changes to the deviations are filed for approval. Because deviations represent a portion of the manual premiums that will not be collected by insurance companies, they are an additional cost associated with the transfer of risk. As mentioned earlier in my testimony, according to the *Statement of Principles Regarding Property and Casualty*

Insurance Ratemaking, indicated rates should reflect the expected costs associated with insuring dwelling policies. Because deviations represent a cost associated with the transfer of risk, the Rate Bureau believes a provision for Deviations is appropriate and necessary. It is my opinion that a 3.95% provision for Deviations in the fire rates and a 1.1% provision for Deviations in the extended coverage rates are reasonable and appropriate based on fundamental actuarial principles.

Q. Does the filing review the rate-level adequacy by territory?

A. Yes. With this filing, the Rate Bureau is proposing to update the territory definitions for dwelling territories to be consistent with the current homeowners territory definitions. Based on the new territory definitions, indicated rate-level changes by territory are calculated using a similar methodology as the statewide indication. A base loss cost is calculated for each territory using the historical loss experience. In addition, a credibility value is assigned to each territory based on the number of house years underlying each loss cost. As mentioned above, the full credibility standards are 500,000 house years for the fire section and 330,000 house years for the extended coverage section. Using the credibility for each territory, a Credibility-Weighted Base Loss Cost is determined by territory. Additional calculations are applied to each territory to reflect expenses, reinsurance, and deviations in a similar manner as applied at a statewide level. The result of these calculations is an Indicated Rate-Level Change by territory. These indicated changes by territory are further allocated between Buildings and Contents based on a similar rate-level indication analysis by class.

In my opinion, the methodology used to develop the indicated rate-level change by territory and by class is reasonable and is consistent with widely-used actuarial ratemaking practices.

Q. Does the filing review the wind exclusion credits and wind mitigation credits?

A. Yes. Based on the indicated rates by territory and by class that are being proposed with this filing, the wind exclusion credits and wind mitigation credits are being updated in a corresponding manner. Using the underlying formula for the statewide rate-level indication, an adjustment is made to the appropriate components of the indication formula to reflect the non-wind losses as a percent of the total losses. The indicated non-wind rate is subtracted from the indicated overall rate to determine the indicated wind exclusion credit for each territory. For those territories where the proposed rate is less than the indicated rate, the wind exclusion credit is similarly reduced such that the resulting non-wind rate remains consistent with the indicated non-wind rate. The wind mitigation credits for each territory are being revised in a manner proportional to the wind exclusion credits.

In my opinion, the methodology used to develop the revised wind exclusion credits and wind mitigation credits is reasonable and is consistent with widely-used actuarial ratemaking practices.

Q. What is the difference between the <u>indicated</u> rate level and the <u>filed</u> rate level?

A. The indicated rate level is the actuarially sound and correct rate level for each territory, each section, and each class. It determines the indicated rate change by territory that is needed to sufficiently cover the expected losses and expenses while still providing a fair and reasonable profit. The indicated rate level is also the rate level that complies with the statutory requirement that insurance rates not be excessive, inadequate, or unfairly discriminatory.

For extended coverage, the statewide indicated rate-level change is 48.6%. Due to differences by territory in historical loss experience, modeled hurricane losses, and other expenses, the indicated change by territory varies throughout the state. For many of the western territories, the indicated change is less than 48.6%, but for many of the territories closer to the coast, the indicated change is greater than 48.6%. In contrast to this, the statewide indicated rate-level change for fire is -16.6%. Similar to the extended coverage segment, the indicated change by territory varies across the state, but the variation is less significant and all territories have an indicated fire change that is negative (i.e., an indicated rate decrease). When the indicated rate changes for fire and extended coverage are combined, the total statewide indicated dwelling rate-level change is 27.2% and a few territories have a combined rate-level change in excess of 50%.

In order to mitigate the impact of these indicated rate changes on policyholders, the Rate Bureau has filed rates that reflect a cap on the combined dwelling rate change by territory. The filing implements the full indicated rate changes by territory for fire. However, the filing caps the rate changes by territory for extended coverage such that the combined dwelling rate change for each territory does not exceed 35%. This capping results in an overall statewide rate-level change of 19.6% instead of the indicated rate-level change of 27.2%.

In my opinion, the Bureau's selected cap of 35% per territory is reasonable and is an effective strategy to mitigate the impact of this filing on those territories with the highest indicated rate changes. However, for those territories that are impacted by the cap (i.e., their indicated rate changes are greater than 35%), it should be noted that the proposed rates in those territories will continue to be inadequate.

Q. I understand that you are not providing an opinion concerning the Underwriting Profit (Profit) provision, the Net Cost of Reinsurance (NCOR) provision, or the Compensation for Assessment Risk (CAR) provision. If I ask you to assume that the provisions for

Profit, NCOR, and CAR are reasonable and actuarially sound, then in your opinion, is the overall rate-level indication shown in the dwelling filing by the North Carolina Rate Bureau reasonable?

A. Yes, if I assume that the provisions for Profit, NCOR, and CAR are reasonable, then in my opinion, the overall dwelling rate-level indication shown by the Rate Bureau is reasonable and actuarially sound.

Q. Again, assuming that the provisions for Profit, NCOR, and CAR are reasonable, do you have an opinion whether the proposed rates, as capped in the filing, reasonably provide for the expected costs for dwelling insurance in North Carolina?

A. If I assume that the provisions for Profit, NCOR, and CAR are reasonable, then in my opinion, the proposed rates in this filing reasonably reflect the expected costs for dwelling insurance. However, in those territories where the Rate Bureau has capped the rates in this filing to mitigate the impact on affected policyholders, the proposed rates do not reflect all expected costs. The expected costs that can be quantified by the difference between a territory's indicated rate change and its capped rate change are not being reflected in the proposed rates.

Q. Assuming that the provisions for Profit, NCOR, and CAR are reasonable, in your opinion, are the proposed dwelling rates not excessive, inadequate, or unfairly discriminatory?

A. If I assume that the provisions for Profit, NCOR, and CAR are reasonable, then in my opinion, the proposed dwelling rates in this filing are not excessive or unfairly discriminatory. Similarly, the rates in those territories unaffected by the proposed cap are not inadequate; however, in those territories where the Rate Bureau is proposing to cap the effect of this filing, the proposed rates continue to be inadequate by the difference between the indicated rate change and the capped rate change.

Q. Does this conclude your testimony?

A. Yes, it does.

PREFILED TESTIMONY
OF
JAMES H. VANDER WEIDE

2016 DWELLING INSURANCE RATE FILING
BY THE NORTH CAROLINA RATE BUREAU

Q. WHAT IS YOUR NAME, OCCUPATION, AND BUSINESS ADDRESS?

A. My name is James H. Vander Weide. I am President of Financial Strategy Associates, a firm that provides strategic and financial consulting services to corporate clients. My business address is 3606 Stoneybrook Drive, Durham, North Carolina 27705.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND PRIOR ACADEMIC EXPERIENCE.

A. I graduated from Cornell University with a Bachelor’s Degree in Economics and then attended Northwestern University where I earned a Ph.D. in Finance. I joined the faculty of the School of Business at Duke University where I was subsequently named Assistant Professor, Associate Professor, Professor, and Research Professor. I have published research in the areas of finance and economics and taught courses in these fields at Duke for more than thirty-five years. I am now retired from my teaching duties at Duke.

I have taught courses in corporate finance, investment management, and management of financial institutions. I also taught a graduate seminar on the theory of public utility pricing and lectured in executive development seminars on the cost of capital, financial analysis, capital budgeting, mergers and acquisitions, cash management, short-run financial planning, and competitive strategy.

I have served as Program Director and taught in numerous executive education programs at Duke, including the Duke Advanced Management Program, the Duke Management Challenge, the Duke Executive Program in Telecommunications, Competitive Strategies in Telecommunications, and the Duke Program for Manager Development for managers from the former Soviet Union. I have also taught in tailored programs developed for corporations such as ABB, Accenture, Allstate, AT&T, Progress Energy, GlaxoSmithKline, Lafarge, MidAmerican Energy, Norfolk Southern, The Rank Group, Siemens, TRW, and Wolseley PLC.

In addition to my teaching and executive education activities, I have written research papers on such topics as portfolio management, the cost of capital, capital budgeting, the effect of regulation on the performance of

public utilities, and cash management. My articles have been published in *American Economic Review, Financial Management, International Journal of Industrial Organization, Journal of Finance, Journal of Financial and Quantitative Analysis, Journal of Bank Research, Journal of Accounting Research, Journal of Cash Management, Management Science, The Journal of Portfolio Management, Atlantic Economic Journal, Journal of Economics and Business,* and *Computers and Operations Research.* I have written a book titled *Managing Corporate Liquidity: an Introduction to Working Capital Management*, a chapter for *The Handbook of Modern Finance*, "Financial Management in the Short Run," and a chapter for the book, *The Handbook of Portfolio Construction: Contemporary Applications of Markowitz Techniques,* "Principles for Lifetime Portfolio Selection: Lessons from Portfolio Theory."

Q. HAVE YOU PREVIOUSLY PRESENTED EVIDENCE ON THE COST OF CAPITAL AND OTHER REGULATORY ISSUES?

A. Yes. As an expert on financial and economic theory and practice, I have participated in approximately five hundred regulatory and legal proceedings before the U.S. Congress, the Canadian Radio-Television and Telecommunications Commission, the Federal Communications Commission, the National Telecommunications and Information Administration,

the Federal Energy Regulatory Commission, the National Energy Board (Canada), the public utility commissions of forty-five states and four Canadian provinces, the insurance commissions of five states, the Iowa State Board of Tax Review, the National Association of Securities Dealers, and the North Carolina Property Tax Commission. In addition, I have prepared expert testimony in proceedings before the U.S. Tax Court, the U.S. District Court for the District of Nebraska; the U.S. District Court for the District of New Hampshire; the U.S. District Court for the District of Northern Illinois; the U.S. District Court for the Eastern District of North Carolina; the Montana Second Judicial District Court, Silver Bow County; the U.S. District Court for the Northern District of California; the Superior Court, North Carolina; the U.S. Bankruptcy Court for the Southern District of West Virginia; the U. S. District Court for the Eastern District of Michigan; and the Supreme Court of the State of New York.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I have been asked by the North Carolina Rate Bureau to make an independent appraisal of the aggregate cost of equity capital for the companies writing dwelling insurance in North Carolina and to recommend a rate of return on equity that is fair, that allows those companies in the aggregate

to attract and retain capital on reasonable terms, that is commensurate with returns on investments of comparable risk, and that maintains the financial integrity of those companies in the aggregate.

Q. WHAT DO YOU MEAN BY THE PHRASE “COST OF EQUITY CAPITAL?”

A. A firm’s cost of equity capital is the rate of return expectation that is required in the marketplace on equity investments of comparable risk. If an investor does not expect to earn a return on an equity investment in a firm that is at least as large as the return the investor could expect to earn on other investments of comparable risk, then the investor will not invest in that firm’s shares. Thus, a firm’s cost of equity capital is also the rate of return expectation that is required in the marketplace in order to induce equity investors to purchase shares in that firm.

Q. IS THE COST OF EQUITY CAPITAL THE SAME AS THE RETURN ON EQUITY?

A. No. The cost of equity capital is a market-based concept that reflects investors’ future expectations, while the return on equity is an accounting concept that measures results of past performance. The return on equity is equal

to income available for common equity divided by the book value of common equity.

Q. HAVE YOU FORMED AN OPINION REGARDING THE COST OF EQUITY CAPITAL FOR THE AVERAGE COMPANY WRITING DWELLING INSURANCE IN NORTH CAROLINA?

A. Yes.

Q. WHAT IS YOUR OPINION IN THAT REGARD?

A. The cost of equity capital for such a company is in the range 8.6 percent to 12.2 percent.

Q. WHAT ECONOMIC PRINCIPLES DID YOU CONSIDER IN ARRIVING AT THAT OPINION?

A. There are two primary economic principles relevant to my appraisal of the cost of equity capital. The first, relating to the demand for capital, states that a firm should continue to invest in its business only so long as the return on its investment is greater than or equal to its cost of capital. In the context of a regulated firm, this principle suggests that the regulatory agency should establish revenue levels which will offer the firm an opportunity to earn a return on its investment that is at least equal to its cost of capital.

The second principle, relating to the supply of capital, states that rational investors are maximizing their total return on capital only if the returns they expect to receive on investments of comparable risk are equal. If these returns are not equal, rational investors will reduce or completely eliminate investments in those activities yielding lower expected returns for a given level of risk and will increase investments in those activities yielding higher expected returns. The second principle implies that regulated firms will be unable to obtain the capital required to expand service on reasonable terms unless they are able to provide investors returns equal to those expected on investments of comparable risk.

Q. DO THESE ECONOMIC PRINCIPLES APPLY TO THE SETTING OF INSURANCE RATES?

A. Yes. These are general economic principles that apply to investing in any business activity, including insurance.

Q. HOW DID YOU GO ABOUT DETERMINING THE COST OF EQUITY CAPITAL FOR THE AVERAGE COMPANY WRITING DWELLING INSURANCE IN NORTH CAROLINA?

A. I used two generally accepted methods to estimate the cost of equity: (i) the Discounted Cash Flow (DCF) Model, and (ii) the Risk Premium Approach.

Q. PLEASE DESCRIBE THE DCF MODEL.

A. The DCF Model suggests that investors value an asset on the basis of the future cash flows they expect to receive from owning the asset. Thus, investors value an investment in a bond because they expect to receive a sequence of semi-annual coupon payments over the life of the bond and a terminal payment equal to the bond's face value at the time the bond matures. Likewise, investors value an investment in a firm's stock because they expect to receive a sequence of dividend payments and, perhaps, expect to sell the stock at a higher price sometime in the future.

A second fundamental principle of the DCF approach is that investors value a dollar received in the future less than a dollar received today. This is because, if they had the dollar today, they could invest it in an interest earning account and increase their wealth. This principle is called the time value of money.

Applying the two fundamental DCF principles noted above to an investment in a bond suggests that investors should value their investment in the bond on the basis of the present value of the bond's future cash flows. Thus, the price of the bond should be equal to:

Equation 1

$$P_B = \frac{C}{(1+i)} + \frac{C}{(1+i)^2} + \ldots + \frac{C+F}{(1+i)^n}$$

where:

P_B	=	Bond price;
C	=	Cash value of the coupon payment (assumed for notational convenience to occur annually rather than semi-annually);
F	=	Face value of the bond;
i	=	The rate of interest the investor could earn by investing his money in an alternative bond of equal risk; and
n	=	The number of periods before the bond matures.

Applying these same principles to an investment in a firm's stock suggests that the price of the stock should be equal to:

Equation 2

$$P_S = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \ldots + \frac{D_n + P_n}{(1+k)^n}$$

where:

P_S	=	Current price of the firm's stock;
$D_1, D_2 \ldots D_n$	=	Expected annual dividend per share on the firm's stock;
P_n	=	Price per share of stock at the time the investor expects to sell the stock; and
k	=	Return the investor expects to earn on alternative investments of the same risk, i.e., the investor's required rate of return.

Equation (2) is frequently called the Annual Discounted Cash Flow (DCF) Model of stock valuation.

Q. HOW DO YOU USE THE DCF MODEL TO DETERMINE THE COST OF EQUITY CAPITAL?

A. The “k” in the equation is the cost of equity capital. We make certain simplifying assumptions regarding the other factors in the equation and then mathematically solve for “k.”

Q. WHAT ARE THE ASSUMPTIONS YOU MAKE?

A. Most analysts make three simplifying assumptions. First, they assume that dividends are expected to grow at the constant rate (“g”) into the indefinite future. Second, they assume that the stock price at time “n” is simply the present value of all dividends expected in periods subsequent to “n.” Third, they assume that the investors’ required rate of return, “k,” exceeds the expected dividend growth rate, “g.”

Q. DOES THE ANNUAL DCF MODEL OF STOCK VALUATION PRODUCE APPROPRIATE ESTIMATES OF A FIRM’S COST OF EQUITY CAPITAL?

A. No. The Annual DCF Model of stock valuation produces appropriate estimates of a firm’s cost of equity capital only if the firm pays dividends just once a year. Since

most firms pay dividends quarterly, the Annual DCF Model produces downwardly biased estimates of the cost of equity. Investors can expect to earn a higher annual effective return on an investment in a firm that pays quarterly dividends than in one which pays the same amount of dollar dividends once at the end of each year. A complete analysis of the implications of the quarterly payment of dividends on the DCF Model is provided in Exhibit RB-12. For the reasons cited there, I employed the Quarterly DCF Model throughout my calculations.

Q. PLEASE DESCRIBE THE QUARTERLY DCF MODEL YOU USED.

A. The Quarterly DCF Model I used is described by Equation 10 on page 11 in Exhibit RB-12. This equation shows that the cost of equity is: the sum of the dividend yield and the growth rate, where the dividend in the dividend yield is the equivalent dividend at the end of the year, and the growth rate is the expected growth in dividends or earnings per share.

Q. HOW DO YOU APPLY THE DCF APPROACH TO OBTAIN THE COST OF EQUITY CAPITAL FOR THE COMPANIES WRITING DWELLING INSURANCE IN NORTH CAROLINA?

A. I apply the DCF approach to two groups of companies: Value Line's group of property/casualty insurance companies and the S&P 500.

Q. WHY DO YOU APPLY THE DCF APPROACH TO THE S&P 500 AS WELL AS TO VALUE LINE'S PROPERTY/CASUALTY INSURANCE COMPANIES?

A. As I noted previously, the cost of equity is defined as the rate of return investors expect to earn on investments in other companies of comparable risk. I apply the DCF approach to the S&P 500 because they are a large group of companies that, on average, are typically viewed as being comparable in risk to the property/casualty insurance industry. The use of a larger set of comparable risk companies should provide an accurate estimate of the cost of equity for the companies writing dwelling insurance in North Carolina.

Q. DO YOU INCLUDE ALL THE VALUE LINE PROPERTY/CASUALTY INSURANCE COMPANIES?

A. No. Among the Value Line property/casualty insurance companies, I only include companies which pay a quarterly dividend, have not lowered their dividends, and have a positive five-year earnings growth forecast available from I/B/E/S (formerly known as the Institutional Brokers

Estimate System, now part of Thomson Reuters).[1] The Value Line property/casualty companies I use are shown in Exhibit RB-10.

Q. WHAT CRITERIA DO YOU USE TO SELECT COMPANIES IN THE S&P 500?

A. I include those firms which pay dividends and which have at least three five-year earnings forecasts available from I/B/E/S. I exclude the insurance companies in the S&P 500, as identified by I/B/E/S Thomson Reuters, because I have already calculated DCF results for the Value Line property/casualty insurance companies. The S&P 500 companies I use are shown in Exhibit RB-11.

Q. WHY DO YOU ELIMINATE ANY COMPANY WHICH HAD RECENTLY LOWERED ITS DIVIDEND OR WHICH FAILS TO PAY DIVIDENDS?

A. I eliminate those companies because it is difficult to make a reliable estimate of the future dividend growth rate for companies that have recently lowered their dividends or do not pay dividends. If a company has recently lowered its dividend, investors do not know whether the company will

---

[1] I have previously included companies that had three or more long-term earnings growth forecasts. However, at this time, the criterion requiring at least three long-term earnings growth forecasts produces a group of only five Value Line property/casualty insurance companies. Therefore, at this time I report DCF results for all property casualty insurance companies that have a positive long-term earnings growth forecast from I/B/E/S.

again lower its dividend in the future, or whether the company will attempt to increase its dividend back toward its previous level. If a company does not pay a dividend, one cannot mathematically apply the DCF approach.

Q. HOW DO YOU ESTIMATE THE GROWTH COMPONENT OF THE QUARTERLY DCF MODEL?

A. I use the average of analysts' estimates of future earnings per share (EPS) growth reported by I/B/E/S. As part of their research, financial analysts working at Wall Street firms periodically estimate EPS growth for each firm they follow. The EPS forecasts for each firm are then published. The forecasts are used by investors who are contemplating purchasing or selling shares in individual companies.

Q. WHAT IS I/B/E/S?

A. I/B/E/S is a collection of analysts' forecasts for a broad group of companies expressed in terms of a mean forecast and a standard deviation of forecast for each firm. The mean forecast is used by investors as an estimate of future firm performance.

Q. WHY DO YOU USE THE I/B/E/S GROWTH ESTIMATES?

A. The I/B/E/S growth rates (1) are widely circulated in the financial community, (2) include the projections of

reputable financial analysts who develop estimates of future growth, (3) are reported on a timely basis to investors, and (4) are widely used by institutional and other investors. For these reasons, I believe these estimates represent unbiased estimates of investors' expectations of each firm's long-term growth prospects and, accordingly, are incorporated by investors into their return requirements. Consequently, in my opinion, they provide the best available estimate of investors' long-term growth expectations.

Q. WHY DO YOU RELY EXCLUSIVELY ON ANALYSTS' PROJECTIONS OF FUTURE EPS GROWTH IN ESTIMATING THE INVESTORS' EXPECTED GROWTH RATE RATHER THAN LOOKING AT PAST HISTORICAL GROWTH RATES?

A. There is considerable empirical evidence that analysts' forecasts are more highly correlated with stock prices than are firms' historical growth rates, and, thus, that investors actually use these forecasts.

Q. HAVE YOU PERFORMED ANY STUDIES CONCERNING THE USE OF ANALYSTS' FORECASTS AS THE BEST ESTIMATE OF INVESTORS' EXPECTED GROWTH RATE, G?

A. Yes, I prepared a study with Willard T. Carleton, Professor of Finance Emeritus at the University of Arizona, on why

analysts' forecasts provide the best estimate of investors' expectations of future long-term growth. This study is described in a paper entitled "Investor Growth Expectations: Analysts vs. History," published in *The Journal of Portfolio Management*.

Q. PLEASE SUMMARIZE THE RESULTS OF YOUR STUDY.

A. First, we performed a correlation analysis to identify the historically-oriented growth rates which best described a firm's stock price. Then we did a regression study comparing the historical growth rates with the consensus analysts' forecasts. In every case, the regression equations containing the average of analysts' forecasts statistically outperformed the regression equations containing the historical growth estimates. These results are consistent with those found by Cragg and Malkiel, the early major research in this area. These results are also consistent with the hypothesis that investors use analysts' forecasts, rather than historically-oriented growth calculations, in making buy and sell decisions. They provide overwhelming evidence that the analysts' forecasts of future growth are superior to historically-oriented growth measures in predicting a firm's stock price.

Q. WHAT PRICE DO YOU USE IN YOUR DCF MODEL?

A. I use a simple average of the monthly high and low stock prices for each firm for the three-month period, March, April, and May 2016. These high and low stock prices are obtained from Thomson Reuters.

Q. WHY DO YOU USE THE THREE-MONTH AVERAGE STOCK PRICE, P_0, IN APPLYING THE DCF METHOD?

A. I use a three-month average stock price in applying the DCF method because stock prices fluctuate daily, while financial analysts' forecasts for a given company are generally changed less frequently, often on a quarterly basis. Thus, to match the stock price with an earnings forecast, it is appropriate to average stock prices over a three-month period.

Q. PLEASE EXPLAIN YOUR INCLUSION OF FLOTATION COSTS.

A. All firms that have sold securities in the capital markets have incurred some level of flotation costs, including underwriters' commissions, legal fees, printing expense, etc. These costs are paid from the proceeds of the stock sale and must be recovered over the life of the equity issue. Costs vary depending upon the size of the issue, the type of registration method used and other factors, but in general these costs range between four percent and five percent of the proceeds from the issue. In addition to

these costs, the underwriter's offer price is set below the most recent closing price before the public offering in order to reduce the risk that the underwriters will be unable to sell the entire offering at the offer price. The difference between the offer price and the recent closing price is generally in the range two percent to three percent. Thus, the total flotation cost, including both issuance expense and underwriter discount, could range anywhere from five percent to eight percent of the proceeds of an equity issue. These cost ranges have been developed and confirmed in a number of generally accepted studies. I believe a combined five percent allowance for flotation costs is a conservative estimate that should be used in applying the DCF model in this proceeding.

Q. PLEASE SUMMARIZE THE RESULTS OF YOUR APPLICATION OF THE DCF METHOD TO THE PROPERTY/CASUALTY INSURANCE COMPANIES AND THE S&P 500.

A. As shown in Exhibits RB-10 and RB-11, the average DCF cost of equity capital for my group of Value Line property/casualty companies is 10.7 percent; and for the S&P 500 companies, 12.2 percent.

Q. WHAT CONCLUSION DO YOU REACH FROM YOUR DCF ANALYSIS ABOUT THE COST OF EQUITY CAPITAL FOR COMPANIES WRITING DWELLING INSURANCE IN NORTH CAROLINA?

A. On the basis of my DCF analysis, I would conclude that for companies writing dwelling insurance in North Carolina the cost of equity is in the range 10.7 percent to 12.2 percent.

Q. YOU NOTE THAT THE SECOND METHOD YOU USE TO ESTIMATE THE COST OF EQUITY CAPITAL FOR COMPANIES WRITING DWELLING INSURANCE IN NORTH CAROLINA IS A RISK PREMIUM APPROACH. PLEASE DESCRIBE THAT APPROACH.

A. I perform a study of the comparable returns received by bond and stock investors over the last ninety years. I estimate the returns on stock and bond portfolios, using stock price and dividend yield data on the S&P 500 stock portfolio and bond yield data on Moody’s A–rated utility bonds.

My study consists of analyzing the historically achieved returns on broadly based stock and bond portfolios going back to 1926. For stocks, I use the S&P 500 stock portfolio; and for bonds, I use Moody’s A-rated utility bonds. The resulting annual returns on the stock and bond portfolios purchased in each year from 1926 through 2015 are shown on Exhibit RB-13. The difference between the

stock return and the bond return over that period of time on an arithmetic average basis is 4.5 percentage points.

Q. WHAT CONCLUSIONS DO YOU DRAW FROM YOUR RISK PREMIUM ANALYSES?

A. My own studies, combined with my analysis of other studies, provide strong evidence for the belief that investors today require an equity return of at least 4.53 percentage points above the expected yield on A-rated long-term debt issues.

Interest rates on Moody's seasoned A-rated utility bonds during the three months March through May 2016 range from 3.93 percent to 4.16 percent. On the basis of this information and my knowledge of bond market conditions, I conclude that the long-term yield on A-rated utility bonds is approximately 4.03 percent. Adding a 4.53 percentage point risk premium to the 4.03 percent expected yield on A-rated utility bonds, I obtain an expected return on equity of 8.56 percent.

Q. ARE THERE REASONS TO BELIEVE THAT THE RESULT OF YOUR EX POST RISK PREMIUM ANALYSIS MAY UNDERESTIMATE THE COST OF EQUITY AT THIS TIME?

A. Yes. The ex post risk premium model may produce an unrealistically low result because the model result is

highly sensitive to the estimate of the bond yield. At this time, bond yields are unusually low, reflecting policy decisions of the U.S. government and the U.S. Federal Reserve Bank to keep interest rates low in order to stimulate the economy. Since the ex post risk premium cost of equity result is the sum of the risk premium and the bond yield, the use of an unusually low bond yield in the model may cause the ex post risk premium model result to underestimate the cost of equity. Because the cost of equity is a forward-looking concept, it would be reasonable to apply the ex post risk premium model using a forecast of the expected bond yield, rather than a recent bond yield. Because bond yields are expected to increase over the next several years, the use of a forecasted bond yield would produce a significantly higher ex post risk premium estimate of the cost of equity. Thus, I consider my ex post risk premium model result to be conservative.

Q. BASED ON YOUR ANALYSES, WHAT IS YOUR OPINION AS TO THE COST OF CAPITAL FOR THE AVERAGE INSURANCE COMPANY WRITING DWELLING INSURANCE IN NORTH CAROLINA?

A. Based on my review and studies, I believe that a conservative estimate of the cost of common equity capital for the average insurance company writing dwelling

insurance in North Carolina is in the range 8.6 percent to 12.2 percent.

SUMMARY OF DISCOUNTED CASH FLOW ANALYSIS FOR PROPERTY/CASUALTY INSURANCE COMPANIES

	COMPANY	MOST RECENT QUARTERLY DIVIDEND (D_0)	STOCK PRICE (P_0)	FORECAST OF FUTURE EARNINGS GROWTH	DCF MODEL RESULT
1	Allstate Corp.	0.330	66.338	8.60%	10.8%
2	Amer. Financial Group	0.280	69.968	8.00%	9.8%
3	AmTrust Financial Svcs.	0.150	25.640	12.05%	14.8%
4	Berkley (W.R.)	0.130	55.348	0.46%	1.4%
5	Chubb Ltd.	0.670	120.448	8.33%	11.0%
6	CNA Fin'l	0.250	31.740	2.59%	6.1%
7	Erie Indemnity	0.730	93.765	10.00%	13.7%
8	Mercury General	0.620	53.472	8.00%	13.5%
9	Old Republic	0.188	18.402	10.00%	14.9%
10	RLI Corp.	0.200	65.003	9.80%	11.2%
11	Selective Ins. Group	0.150	35.473	10.00%	12.0%
12	Travelers Cos.	0.610	112.658	2.47%	4.8%
13	XL Group plc	0.200	34.658	11.67%	14.4%
14	Average				10.7%

Note:

d_0	=	Latest quarterly dividend.
d_1, d_2, d_3, d_4,	=	Expected next four quarterly dividends, calculated by multiplying the last four quarterly dividends per Value Line, by the factor (1 + g).
P_0	=	Average of the monthly high and low stock prices during the three months ending May 2016 per Thomson Reuters.
FC	=	Flotation costs.
g	=	I/B/E/S forecast of future earnings growth May 2016.
k	=	Cost of equity using the quarterly version of the DCF Model and a five percent allowance for flotation costs as shown by the formula below:

$$k = \frac{d_1(1+k)^{.75} + d_2(1+k)^{.50} + d_3(1+k)^{.25} + d_4}{P_0(1-FC)} + g$$

SUMMARY OF DISCOUNTED CASH FLOW ANALYSIS FOR S&P 500 COMPANIES

	COMPANY	STOCK PRICE (P_0)	D_0	FORECAST OF FUTURE EARNINGS GROWTH	MODEL RESULT

Note: In applying the DCF Model to the S&P 500, I include in the DCF analysis only those companies in the S&P 500 group which pay a dividend, have a positive growth rate, and have at least three analysts' long-term growth estimates. In addition, I exclude all companies in the I/B/E/S group of insurance companies. I also eliminate those companies with DCF results that varied from the mean by one standard deviation or more.

D_0 = Latest dividend per Thomson Reuters.
d_0 = Latest quarterly dividend.
P_0 = Average of monthly high and low stock prices March, April, and May 2016 per Thomson Reuters.
FC = Selling and flotation costs.
g = I/B/E/S forecast of future earnings growth May 2016.
k = Cost of equity using the quarterly version of the DCF Model and a five percent allowance for flotation costs as shown by the formula below:

$$k = \left[\frac{d_0(1+g)^{\frac{1}{4}}}{P_0(1-FC)} + (1+g)^{\frac{1}{4}} \right]^4 - 1$$

THE QUARTERLY DCF MODEL

The simple DCF Model assumes that a firm pays dividends only at the end of each year. Since firms in fact pay dividends quarterly and investors appreciate the time value of money, the annual version of the DCF Model generally underestimates the value investors are willing to place on the firm's expected future dividend stream. In this appendix, we review two alternative formulations of the DCF Model that allow for the quarterly payment of dividends.

When dividends are assumed to be paid annually, the DCF Model suggests that the current price of the firm's stock is given by the expression:

$$P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \ldots + \frac{D_n + P_n}{(1+k)^n} \quad \textbf{(1)}$$

where

P_0	=	current price per share of the firm's stock,
$D_1, D_2, \ldots, D_n$	=	expected annual dividends per share on the firm's stock,
P_n	=	price per share of stock at the time investors expect to sell the stock, and
k	=	return investors expect to earn on alternative investments of the same risk, i.e., the investors' required rate of return.

Unfortunately, expression (1) is rather difficult to analyze, especially for the purpose of estimating k. Thus, most analysts make a number of simplifying assumptions. First, they assume that dividends are expected to grow at the constant rate g into the indefinite future. Second, they assume that the stock price at time n is simply the present value of all dividends expected in periods subsequent to n. Third, they assume that the investors' required rate of return, k, exceeds the expected dividend growth rate g. Under the above simplifying assumptions, a firm's stock price may be written as the following sum:

$$P_0 = \frac{D_0(1+g)}{(1+k)} + \frac{D_0(1+g)^2}{(1+k)^2} + \frac{D_0(1+g)^3}{(1+k)^3} + \ldots , \qquad \textbf{(2)}$$

where the three dots indicate that the sum continues indefinitely.

As we shall demonstrate shortly, this sum may be simplified to:

$$P_0 = \frac{D_0(1+g)}{(k-g)}$$

First, however, we need to review the very useful concept of a geometric progression.

Geometric Progression

Consider the sequence of numbers 3, 6, 12, 24,…, where each number after the first is obtained by multiplying the preceding number by the factor 2. Obviously, this sequence of numbers may also be expressed as the sequence 3, 3 x 2, 3 x 2^2, 3 x 2^3, … This sequence is an example of a geometric progression.

Definition: A geometric progression is a sequence in which each term after the first is obtained by multiplying some fixed number, called the common ratio, by the preceding term.

A general notation for geometric progressions is: a, the first term, r, the common ratio, and n, the number of terms. Using this notation, any geometric progression may be represented by the sequence:

$$a,\ ar,\ ar^2,\ ar^3, \ldots,\ ar^{n-1}.$$

In studying the DCF Model, we will find it useful to have an expression for the sum of n terms of a geometric progression. Call this sum S_n. Then

$$S_n = a + ar + \ldots + ar^{n-1}. \qquad (3)$$

However, this expression can be simplified by multiplying both sides of equation (3) by r and then subtracting the new equation from the old. Thus,

$$rS_n = ar + ar^2 + ar^3 + \ldots + ar^n$$

and

$$S_n - rS_n = a - ar^n \quad ,$$

or

$$(1 - r)\, S_n = a\,(1 - r^n) \quad .$$

Solving for S_n, we obtain:

$$S_n = \frac{a(1 - r^n)}{(1 - r)} \qquad \textbf{(4)}$$

as a simple expression for the sum of n terms of a geometric progression. Furthermore, if $|r| < 1$, then S_n is finite, and as n approaches infinity, S_n approaches $a \div (1 - r)$. Thus, for a geometric progression with an infinite number of terms and $|r| < 1$, equation (4) becomes:

$$S = \frac{a}{1 - r} \qquad \textbf{(5)}$$

<u>Application to DCF Model</u>

Comparing equation (2) with equation (3), we see that the firm’s stock price (under the DCF assumption) is the sum of an infinite geometric progression with the first term

$$a = \frac{D_0(1 + g)}{(1 + k)}$$

and common factor

$$r = \frac{(1+g)}{(1+k)}$$

Applying equation (5) for the sum of such a geometric progression, we obtain

$$S = a \bullet \frac{1}{(1-r)} = \frac{D_0(1+g)}{(1+k)} \bullet \frac{1}{1-\frac{1+g}{1+k}} = \frac{D_0(1+g)}{(1+k)} \bullet \frac{1+k}{k-g} = \frac{D_0(1+g)}{k-g}$$

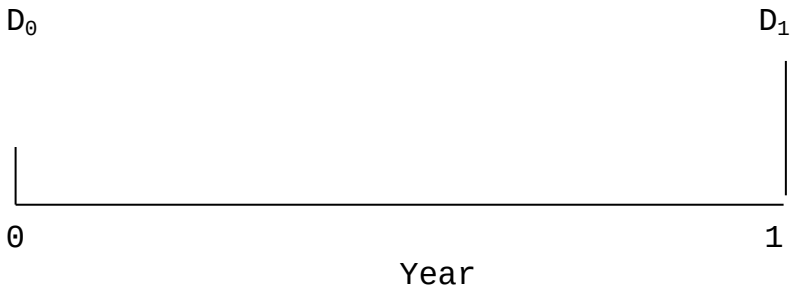
as we suggested earlier.

Quarterly DCF Model

The Annual DCF Model assumes that dividends grow at an annual rate of g% per year (see Figure 1).

Figure 1

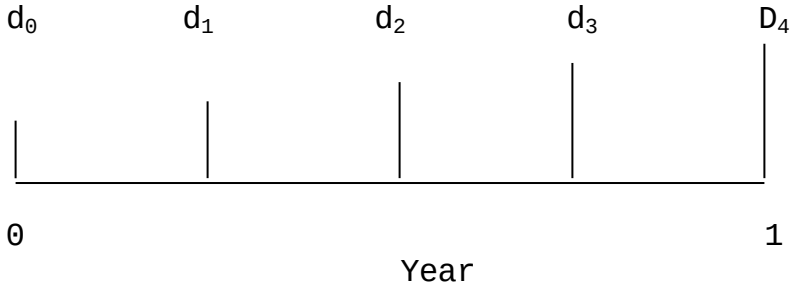
Annual DCF Model



$D_0 = 4d_0$ $\qquad$ $D_1 = D_0(1 + g)$

Figure 2

Quarterly DCF Model (Constant Growth Version)



$d_1 = d_0(1+g)^{.25}$ $\qquad$ $d_2 = d_0(1+g)^{.50}$

$d_3 = d_0(1+g)^{.75}$ $\qquad$ $d_4 = d_0(1+g)$

In the Quarterly DCF Model, it is natural to assume that quarterly dividend payments differ from the preceding quarterly dividend by the factor $(1 + g)^{.25}$, where g is expressed in terms of percent per year and the decimal .25 indicates that the growth has only occurred for one quarter of the year. (See Figure 2.) Using this assumption, along with the assumption of constant growth and ***k*** > ***g***, we obtain a new expression for the firm's stock price, which takes account of the quarterly payment of dividends. This expression is:

$$P_0 = \frac{d_0(1+g)^{\frac{1}{4}}}{(1+k)^{\frac{1}{4}}} + \frac{d_0(1+g)^{\frac{2}{4}}}{(1+k)^{\frac{2}{4}}} + \frac{d_0(1+g)^{\frac{3}{4}}}{(1+k)^{\frac{3}{4}}} + \ldots \qquad \textbf{(6)}$$

where d_0 is the last quarterly dividend payment, rather than the last annual dividend payment. (We use a lower case d to remind the reader that this is not the annual dividend.)

Although equation (6) looks formidable at first glance, it too can be greatly simplified using the formula [equation (4)] for the sum of an infinite geometric progression. As the reader can easily verify, equation (6) can be simplified to:

$$P_0 = \frac{d_0(1+g)^{\frac{1}{4}}}{(1+k)^{\frac{1}{4}} - (1+g)^{\frac{1}{4}}} \qquad \textbf{(7)}$$

Solving equation (7) for ***k***, we obtain a DCF formula for

estimating the cost of equity under the quarterly dividend assumption:

$$k = \left[\frac{d_0(1+g)^{\frac{1}{4}}}{P_0} + (1+g)^{\frac{1}{4}} \right]^4 - 1 \qquad \textbf{(8)}$$

<u>An Alternative Quarterly DCF Model</u>

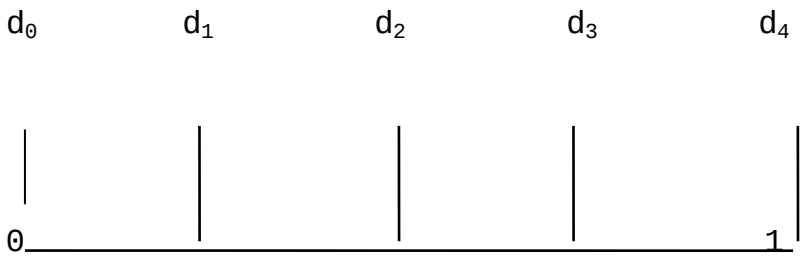
Although the constant growth Quarterly DCF Model [equation (8)] allows for the quarterly timing of dividend payments, it does require the assumption that the firm increases its dividend payments each quarter. Since this assumption is difficult for some analysts to accept, we now discuss a second Quarterly DCF Model that allows for constant quarterly dividend payments within each dividend year.

Assume then that the firm pays dividends quarterly and that each dividend payment is constant for four consecutive quarters. There are four cases to consider, with each case distinguished by varying assumptions about where we are evaluating the firm in relation to the time of its next dividend increase. (See Figure 3.)

Figure 3

Quarterly DCF Model (Constant Dividend Version)

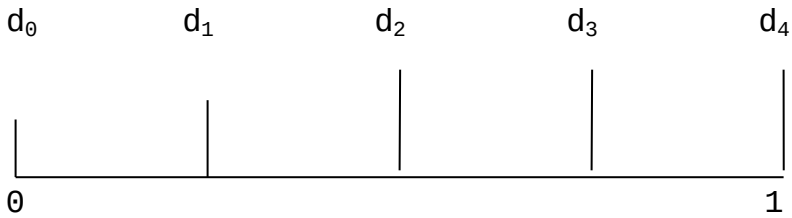
Case 1



Year

$$d_1 = d_2 = d_3 = d_4 = d_0(1+g)$$

Case 2



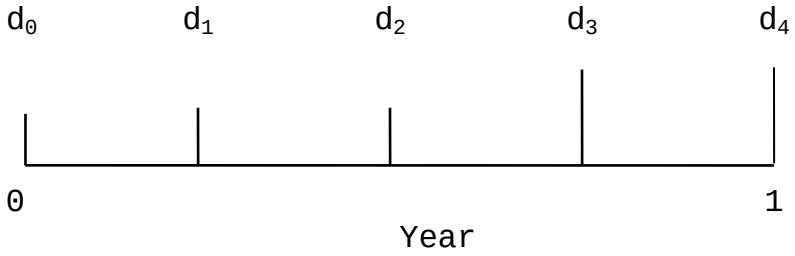
Year

$$d_1 = d_0$$

$$d_2 = d_3 = d_4 = d_0(1+g)$$

Figure 3 (continued)

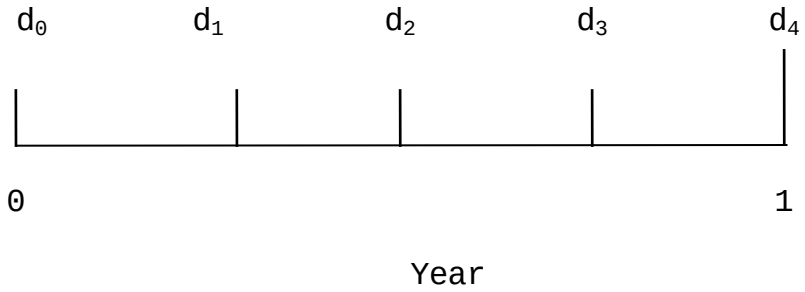
Case 3



$$d_1 = d_2 = d_0$$

$$d_3 = d_4 = d_0(1+g)$$

Case 4



$$d_1 = d_2 = d_3 = d_0$$

$$d_4 = d_0(1+g)$$

If we assume that the investor invests the quarterly dividend in an alternative investment of the same risk, then the amount accumulated by the end of the year will in all cases be given by

$$D_1^* = d_1 (1+k)^{3/4} + d_2 (1+k)^{1/2} + d_3 (1+k)^{1/4} + d_4$$

where d_1, d_2, d_3 and d_4 are the four quarterly dividends. Under these new assumptions, the firm's stock price may be expressed by an Annual DCF Model of the form (2), with the exception that

$$D_1^* = d_1 (1 + k)^{3/4} + d_2 (1 + k)^{1/2} + d_3 (1 + k)^{1/4} + d_4 \qquad \textbf{(9)}$$

is used in place of $D_0(1+g)$. But, we already know that the Annual DCF Model may be reduced to

$$P_0 = \frac{D_0(1+g)}{k-g}$$

Thus, under the assumptions of the second Quarterly DCF Model, the firm's cost of equity is given by

$$k = \frac{D_1^*}{P_0} + g \qquad \textbf{(10)}$$

with D_1^* given by (9).

Although equation (10) looks like the Annual DCF Model, there are at least two very important practical differences. First,

since D_1* is always greater than $D_0(1+g)$, the estimates of the cost of equity are always larger (and more accurate) in the Quarterly Model (10) than in the Annual Model. Second, since D_1* depends on k through equation (9), the unknown “k” appears on both sides of (10), and an iterative procedure is required to solve for k.

COMPARATIVE RETURNS ON S&P 500 STOCKS
AND MOODY'S A-RATED UTILITY BONDS 1926-2015

RISK PREMIUM APPROACH

SOURCE OF DATA

Stock price and yield information is obtained from Standard & Poor's Security Price publication. Standard & Poor's derives the stock dividend yield by dividing the aggregate cash dividends (based on the latest known annual rate) by the aggregate market value of the stocks in the group. The bond price information is obtained by calculating the present value of a bond due in thirty years with a $4.00 coupon and a yield to maturity of a particular year's indicated Moody's A-rated Utility bond yield. The values shown on the ex post risk premium schedule are the January values of the respective indices.

Calculation of Stock and Bond Returns

Sample calculation of "Stock Return" column:

$$\text{Stock Return (2015)} = \left[\frac{\text{Stock Price (2016)} - \text{Stock Price (2015)} + \text{Dividend (2015)}}{\text{Stock Price (2015)}} \right]$$

where Dividend (2015) = Stock Price (2015) x Stock Div. Yield (2015)

Sample calculation of "Bond Return" column:

$$\text{Bond Return (2015)} = \left[\frac{\text{Bond Price (2016)} - \text{Bond Price (2015)} + \text{Interest (2015)}}{\text{Bond Price (2015)}} \right]$$

where Interest = $4.00.

I. QUALIFICATIONS AND SUMMARY

Q. Please state your name and present business address.

A. My name is David Appel, and my business address is 1 Pennsylvania Plaza, New York, NY.

Q. What is your occupation?

A. I am a Principal with the firm of Milliman, Inc.

Q. What is Milliman, Inc?

A. Milliman (formerly Milliman & Robertson) is one of the nation's largest independently owned firms of actuaries and consultants. The company has more than 3200 employees, and operates offices in over 60 cities in the U.S., Europe, Asia, Africa, Australia and Latin America. Our clients number in the thousands: they include insurers, self-insured entities, Federal and State Governments, private corporations, non-profit organizations, unions, and many others.

Q. Please describe your educational and employment history.

A. A complete statement of my educational, employment and academic credentials is included as Exhibit RB-15 filed with this testimony.

To summarize, I have a B.A. in economics from Brooklyn College, City University of New York, and M.A. and Ph.D. degrees in economics from Rutgers University. Prior to 1980, I was an instructor in economics at Rutgers University. For the following nine years, I was employed by the National Council on Compensation Insurance (NCCI), the nation’s largest workers compensation insurance statistical, research and ratemaking organization. I joined NCCI as Research Economist in 1980, and ultimately became Vice President for Research in 1985. In 1989, I joined Milliman, where I founded the economics consulting practice for the firm.

Q. Would you please describe some of your other professional activities?

A. Yes. Throughout my professional career, I have participated in a variety of academic and business activities related to insurance. I have twice been a member of the Board of Directors of the American Risk and Insurance Association, the leading learned society of insurance academics. For many years I was a member of the editorial board of the Journal of Insurance Regulation, the official research publication of the National Association of Insurance Commissioners, and I acted as a peer referee for a number of scholarly journals in economics and insurance. In addition, I was, for twelve years, an Adjunct Professor of Economics at Rutgers University.

Q. Have you ever published any papers or books?

A. Yes. I have authored many papers on various aspects of insurance that have been published in refereed books or scholarly journals. In addition, I have published a large number of papers in non-refereed journals as well. I have also co-edited three volumes of research papers dealing with various aspects of workers compensation and property-casualty insurance. My refereed publications are listed in Exhibit RB-15 filed with this testimony.

Q. Are you a member of any professional associations?

A. Yes. I am a member of the American Risk and Insurance Association, the leading association of insurance academicians. I have also been an elected fellow of the National Academy of Social Insurance, a member of the panel of neutrals of the American Arbitration Association, and a certified arbitrator and umpire of ARIAS, the world's leading insurance and reinsurance arbitration society.

Q. Have you ever testified in insurance rate regulatory proceedings?

A. Yes. I have testified on many occasions in such proceedings during my career, including numerous occasions in North Carolina. A complete list is contained in Exhibit RB-15 filed with this testimony.

Q. What was the general nature of your testimony in these cases?

A. I have addressed a wide variety of insurance issues during public testimony, including such diverse topics as the impact of economic and demographic factors on insurance costs, the effects of regulation on insurance availability, the use of econometric and statistical models in insurance forecasting, and the use of modern financial theory in developing insurance prices. In North Carolina, my testimony has tended to focus on matters relating to the cost of capital and the returns expected from the underwriting profit provisions selected for use in the rates. However, in property rate filings, I have

had substantial involvement in issues relating to catastrophe risk and the net cost of reinsurance, hence my testimony has addressed these issues as well.

Q. Have you been retained by the North Carolina Rate Bureau as a consultant in this rate case?

A. Yes. I have been asked to consider the following specific matters in connection with this case:

1. Whether Dr. Vander Weide's analysis provides a reasonable estimate of the cost of capital.

2. Whether other factors – notably interest rate sensitivity and the small firm size typical of dwelling insurers in North Carolina – create additional sources of risk which affect insurers' cost of capital.

3. How the expected costs of reinsurance should be developed and incorporated into the dwelling extended coverage insurance rates filed by the Rate Bureau and how those costs should be apportioned to regions within the state.

4. How dwelling insurers in North Carolina should be compensated for bearing the risk to their capital associated with exposure to assessments by the North Carolina Insurance Underwriting Association (commonly called the "Beach Plan") and the FAIR Plan (hereinafter referred to jointly as the "Beach/Fair Plans").

5. The returns insurers would expect to earn from underwriting dwelling insurance in North Carolina, given that the filed underwriting profit provision is realized.

I have performed various studies and analyses on these matters.

Q. Before summarizing the conclusions of your analysis, I noticed that a number of issues the Rate Bureau asked you to address refer to both dwelling fire and dwelling extended coverage insurance, while one refers solely to dwelling extended coverage insurance. Can you please explain?

A. Yes. This rate filing pertains to both dwelling fire insurance and dwelling extended coverage (sometimes called "EC") insurance. However, fire and extended coverage cover different perils – as indicated by the name, fire covers solely the fire (and lightning) peril, while extended coverage covers a variety of other perils, most notably wind. Since North Carolina is a hurricane exposed state, the insurance that covers the wind peril has substantially different risk characteristics than lines without such exposure. These different risk characteristics demand that fire and extended coverage be treated differently in certain aspects of the ratemaking exercise.

In this rate filing, the specific areas that relate solely to the catastrophe prone extended coverage insurance are the inclusion of the net cost of reinsurance in the rates, and the allocation of that cost to different regions within the state. In these areas only dwelling extended coverage is affected, hence in those sections of the testimony I refer to dwelling extended coverage only. It is also true, however, that the occurrence of catastrophes occasions an additional cost in North Carolina, due to the possibility that insurers will be assessed for deficits in the state's Beach and Fair plans. Although these deficits would occur because of the occurrence of hurricanes, the deficits will be assessed on all insurers in the state, proportional to their property insurance premiums in North Carolina. Since insurers are liable for assessments related to the fire insurance premiums written in the state, it is necessary to include a provision in the fire rates (along with the extended coverage rates) to cover these expected costs.

Aside from these specific areas, the remainder of my testimony pertains to both dwelling fire and dwelling extended coverage insurance.

Q. Can you please summarize the conclusions you have reached in regard to the matters noted above?

A. Yes. I will summarize them in bullet form here, and then discuss them each more fully later in the testimony.

1. I have reviewed Dr. Vander Weide's cost of capital estimates, which rely on the two most widely recognized models used for this purpose, and find them to be reasonable. However, Dr. Vander Weide's estimates are based on the implicit assumption that insurers present investors with roughly average risk, relative to all possible investment activities. I believe that investors in the property-casualty insurance industry, and particularly in the lines of business at issue in this rate hearing, are subject to an above average degree of risk, and therefore I think it would be prudent to view Dr. Vander Weide's estimates as a conservative estimate of the return to which insurers are entitled.

2. I have also considered the impact of two factors on the risk and required return for insurers – interest rate sensitivity and firm size. These factors affect the required return for insurers generally, regardless of the line of business. As regards interest rate sensitivity, because of the high degree of financial leverage and the substantial share of medium and long term bonds in insurer asset portfolios, insurers are particularly subject to interest rate risk that cannot be diversified away. Based on my previous analyses, I have found that investors must be compensated for this risk in the form of an additional risk premium above that required for the average security. As regards firm size, I have on many occasions studied the size distribution of insurers in North Carolina and found that the firms providing insurance coverage in the state tend to be smaller than those used in Dr. Vander Weide's cost of capital analysis. Since there is conclusive evidence that,

over the long run, smaller firms have earned higher returns, this finding must be considered evidence that investors expect higher returns from small firms.

These analyses provide support for my opinion that Dr. Vander Weide's cost of capital estimates should be viewed as a conservative estimate of the return to which insurers are entitled.

3. In addition to these risk factors, I also note that the dwelling extended coverage insurance at issue in this case is subject to significant catastrophe risk, which is not adequately reflected in Dr. Vander Weide's cost of capital estimates. This is yet another factor supporting my opinion that Dr. Vander Weide's cost of capital estimates should be viewed as conservative.

4. I have considered the differential risk associated with underwriting dwelling extended coverage insurance in different regions within North Carolina, and have concluded that the risk due to catastrophe exposure is substantially greater in and around the coastal regions of the state. Because of this risk insurers purchase reinsurance, and as a result incur significant costs. I have concluded that a provision must be included in the rates to cover the cost of a catastrophe reinsurance program typical of the programs purchased by insurers in hurricane prone regions such as North Carolina. Furthermore, I believe that it is appropriate to apportion this provision across territories within the state, proportional to the relative risk by territory.

5. In addition to the risks attendant to the dwelling insurance directly written by insurers in North Carolina, there is substantial additional risk to insurers attributable to the exposures insured in the Beach/Fair Plans. This risk is associated with the potential for assessments that can be imposed on insurers in the state, should the Beach/Fair Plans incur a deficit arising from their insurance operations. Since insurers must be compensated for bearing such risk, I have developed a procedure to incorporate a provision in the rates that compensates insurers in the state for bearing this risk.

6. In order to test the underwriting profit provisions selected and filed by the Rate Bureau, I have estimated the returns insurers would expect to earn from North Carolina dwelling insurance assuming the filed underwriting profit provision is fully earned, and assuming all of the other assumptions embedded in the rate calculations actually materialize. I am aware that North Carolina law provides that insurers are entitled to expect to earn a return equal to the returns of industries of comparable risk, and that in calculating that expected return, investment income from capital and surplus funds is not to be considered. I refer to that operating return as the statutory return. However, as is evident from the attached exhibits, I have estimated insurer pro forma returns both including and excluding expected investment income from capital and surplus. (I refer to the return including investment income on surplus as the total return.) I have done this to demonstrate that, if the filed underwriting profit provisions are actually

realized, and even if investment income on surplus is considered, insurer returns will not be excessive. Obviously, if returns are not excessive including investment income from capital and surplus, they will be non-excessive excluding such income.

Based on my calculations, the selected underwriting profit provisions generate statutory returns on net worth of 7.7% for dwelling fire and 6.6% for dwelling extended coverage in North Carolina. In addition, the total return on net worth (i.e., including investment income on surplus) is 9.9% for dwelling fire and 9.1% for dwelling extended coverage. Since these returns, even those that include investment income on surplus funds, are near or below the lower bound of Dr. Vander Weide's range for the fair rate of return, I conclude that the underwriting profit provisions are clearly not excessive.

II. COST OF CAPITAL REVIEW

Q. You said your first assignment was to review Dr. Vander Weide's estimate of the cost of capital. Are you familiar with Dr. Vander Weide's approach to estimating the cost of capital in insurance rate cases?

A. Yes. I am aware of the methodology upon which Dr. Vander Weide relies to estimate the cost of capital and have reviewed it on a number of occasions in the course of previous rate cases in North Carolina. Dr. Vander Weide has used the most widely recognized and accepted models for this purpose, namely the Discounted Cash Flow (DCF) model and the risk premium method. These models, when taken together and properly applied to a reasonably selected data set, provide acceptable estimates of the cost of capital for regulated insurers.

Q. What has Dr. Vander Weide concluded with respect to the fair rate of return in this case?

A. Dr. Vander Weide has concluded that the fair rate of return for insurers is in the range of 8.6% to 12.2% on net worth as determined under generally accepted accounting principles (GAAP).

Q. In your opinion, is this an appropriate estimate of the required rate of return?

A. Yes, however as I indicated a moment ago, I believe that Dr. Vander Weide may have been conservative in his calculation of the required rate of return. Dr. Vander Weide has assumed that the property-casualty industry presents investors with average risk. However, based on my studies, I conclude the following:

1. There is evidence that the property casualty industry is considerably above average with respect to the volatility of the returns that it provides to investors.

This higher volatility of returns makes the property-casualty industry an investment of above average risk.

2. Since investors require higher returns from smaller firms, and since the firms in Dr. Vander Weide's cost of capital analysis are significantly larger than the average property-casualty insurer in North Carolina, his approach tends to underestimate the true cost of capital for North Carolina dwelling insurers.

III. ADDITIONAL FACTORS AFFECTING RISK

Q. Your comments suggest that Dr. Vander Weide's cost of capital may be understated for insurers writing dwelling insurance in North Carolina. Can you please elaborate on this?

A. Certainly. As mentioned in the summary, I have considered whether other factors not addressed in the standard cost of capital analysis conducted by Dr. Vander Weide might indeed affect the risk and therefore the required return in this case. In fact, there were two such factors – interest rate risk and the small size of firms writing dwelling insurance in the state - that I have been studying for a number of years and which clearly increase the cost of capital, or required return, in this case. Based on analyses I have conducted for previous rate hearings in North Carolina, I have concluded that both these factors create additional risks that require additional compensation above that demanded for the average security.

In addition to these factors (which affect risk and required returns for all lines of insurance), for the lines of coverage at issue in this case, the exposure to catastrophic losses associated with hurricanes in North Carolina contributes to additional risk that is otherwise not reflected in standard cost of capital analyses. As with interest rate risk and small firm size, this additional risk requires compensation in the market, beyond that implied by the analyses conducted by Dr. Vander Weide. I will discuss these issues briefly below.

Q. You have made reference to the term interest rate risk. Can you please define this term?

A. Yes. Interest rate risk refers to the risk that the value of fixed income investments (such as bonds) will fluctuate with changes in interest rates. This means that there is a risk associated with holding bonds, particularly those with a relatively long term to maturity. While investments in equities are still considerably riskier than investments in long term bonds, as evidenced by the fact that returns to large company stocks have had a much higher mean and standard deviation than returns on long term government bonds over the past 80+ years, bonds investments impose risk as well.

Q. Does interest rate risk affect investments in property-casualty insurance stocks?

A. Yes. Property-casualty insurance companies invest large amounts of funds in bonds issued by both corporations and governmental bodies. The risk that investors face is that when interest rates change, the values of the bonds also change, and hence their investments in property-casualty stocks are subject to interest rate risk. This fact is widely recognized by the financial community. Since investors cannot diversify away interest rate risk, only the prospect of higher returns will induce them to purchase interest-sensitive stocks. That is, investors must be compensated for purchasing interest-sensitive stocks because they are increasing their exposure to interest rate risk. This is a risk separate and apart from the market risk investors face.

Q. Why is interest rate risk different from market risk?

A. In general, risk that is not diversifiable is known as systematic risk, or market risk. Systematic risk stems from events that take place on an economy-wide basis. Investors can only diversify away risks that have offsetting factors somewhere else in the economy. For instance, if one company has a bad year due to reasons specific to it alone, it is highly likely that another company will have a good year which will offset the bad performance. That sort of risk is diversifiable. However, the risk associated with events that take place economy-wide without offsetting factors is not diversifiable. It is this risk that is referred to as systematic risk or market risk.

Interest rate risk is a separate source of volatility for insurance stocks. Interest rates often change as a result of changes in expectations of future inflation. These changes primarily affect firms that hold what are called nominal assets and liabilities. Nominal assets and liabilities have cash flows that are fixed in nominal terms (for example, accounts receivable, most contracts, and bonds) and are thus subject to erosion in value due to inflation. On the other hand, the cash flows associated with manufacturing and service operations tend to fluctuate with the price level. Since most non-financial firms hold relatively few nominal assets and liabilities, their stocks are not particularly sensitive to changes in interest rates that are due to changes in expected inflation. Therefore interest rate risk adds additional risk to insurance stocks, above and beyond market risk, that is not diversifiable.

Changes in interest rates that are not associated with changes in expected inflation will affect all stocks. This accounts for the moderate degree of correlation between changes in long term interest rates and returns to common stocks. However, the fact that most stocks are not very sensitive to changes in interest rates that are due to changes in expected inflation means that interest rate risk is not fully captured in measures of market risk.

Q. Is it possible to measure interest rate risk?

A. Yes, and in the past I have conducted a number of studies designed specifically to address this issue. The principal conclusions of those studies is that since insurer assets on

average have a substantially longer financial duration than insurance liabilities, when interest rates change, the value of insurer equity is subject to potentially wide fluctuation. While the market risk for insurers as measured by beta is roughly average, the degree of interest rate risk to which the industry is exposed is considerably higher than average. Since this risk cannot be entirely diversified away, the overall risk associated with an investment in property/casualty insurance is greater than average. As a consequence, insurers are entitled to a rate of return above that allowed for the average risk investment in the U.S. economy. I believe that there are three main reasons for this conclusion.

First, as noted, the high degree of financial leverage and mismatched durations of assets and liabilities contributes to the volatility of returns to investors in insurance stocks.

Second, the insurance industry is in the business of bearing risk. Individuals and corporations transfer to property-casualty insurers the potential liability for a wide range of possible adverse events, ranging from property damage to professional liability. In light of the unforeseen events that can occur, and, in the recent past, actually have occurred, investors in property-casualty insurance stocks are subject to considerable risk.

Finally, insurance is in the unique position of being a highly competitive industry that is also subject to a high degree of regulation. This combination of regulation and competition creates an environment in which insurers are subject not only to the demands of the market but also to the pressures of the political process. There is substantial evidence that regulation can increase risk for a regulated enterprise, and when that is combined with an aggressively competitive industrial structure, risk is increased.

Q. You said that the combination of regulation and competition increased risk for insurers. Can you describe what you mean?

A. Yes. Traditionally, direct price and rate of return regulation has been imposed on industries known as "public utilities," such as generation and transmission of electric power, distribution of natural gas, provision of local water and sewer service and the like. Because of the nature of the production process, these industries are characterized as "natural monopolies," meaning that it is most efficient for a single producer to provide the service in question. In such circumstances, the state normally grants a monopoly to a single provider and then regulates that firm directly to prevent abuse of monopoly power.

Property-casualty insurance differs dramatically from this model. Rather than a single firm providing service, there are in most states literally hundreds of firms competing in the market, none of which typically have significant market power. These firms compete aggressively to increase market share and attract the best insureds by offering a variety of price and quality combinations that are best tailored to their business objectives. This vigorous competition provides discipline in the marketplace, and, when combined with direct rate of return regulation, the risk for insurers is increased.

I should note that historically, a number of competitively structured industries (such as airlines, trucking, and telecommunications) were subject to regulation, but in the past several decades there has been a movement to deregulate these activities. This is due in part to the widespread agreement that competition itself is an adequate regulator.

Q. You also said that you considered whether the size distribution of North Carolina insurers should impact the cost of capital in this case. Can you please describe this issue briefly and discuss its implications for this case?

A. Yes. It is a well established fact of empirical finance that small stocks tend to outperform large stocks. Ibbotson Associates, for instance, reports that firms in the ninth and tenth deciles of stocks listed on the principal U.S. stock exchanges have outperformed the market as a whole by approximately 4.5 percentage points over the period 1926 to 2015, even after accounting for the fact that these firms have above average betas. Therefore an adjustment should be made to the cost of capital to the extent that the property-casualty insurance industry is composed of small stocks.

Q. Have you conducted any studies with respect to the significance of the small stock effect?

A. Yes. As with interest rate risk, I have conducted a number of studies of this issue in previous years, and in each instance I found that (1) investors have earned higher returns from small stocks than from large stocks, and (2) the insurers in Dr. Vander Weide's cost of capital analysis are among the larger companies in the U.S. economy. The insurers in Dr. Vander Weide's analysis are larger, on average, than the companies in the property-casualty insurance industry, and they are larger, on average, than the companies writing dwelling insurance in North Carolina.

These facts suggest that the cost of capital for insurers writing dwelling insurance in North Carolina should be higher than for those firms contained in Dr. Vander Weide's cost of capital analysis. This reaffirms my conclusion that the cost of capital Dr. Vander Weide has presented is conservative.

Q. You also mentioned the impact of catastrophe risk on the cost of capital. Can you please discuss that briefly?

A. Yes. The potential for catastrophic losses from hurricanes produces additional risk to insurers beyond that captured in the cost of capital models relied upon by Dr. Vander Weide. The estimated cost of capital for the insurers in Dr. Vander Weide's sample reflects the average risk across all the activities of those insurers, and not just the risk of catastrophe exposed property insurance (which is the risk that should be considered in this case). Since catastrophe exposed lines of business are significantly riskier than average, the cost of capital for those lines is higher as well.

Q. Can you please summarize your testimony on the cost of capital of the property-casualty insurance industry?

A. Yes. Dr. Vander Weide has assumed that the property-casualty insurance industry presents investors with risks comparable to the average investment in equities. My analysis has shown that property-casualty insurance stocks are subject to additional volatility due to interest rate sensitivity, are relatively small when compared with the broad cross section of publicly traded firms in the U.S. economy, and are subject to risk from catastrophic events. Since each of these additional risks require compensation in the form of a higher return, I conclude that Dr. Vander Weide has been conservative in his calculation of the required rate of return on property-casualty insurance investments.

IV. NET COST OF REINSURANCE & TERRITORIAL ALLOCATIONS

Q. In your summary, you said you considered how the net cost of reinsurance should be included in dwelling insurance rates in North Carolina, and how the profit in the rates should be allocated proportional to risk. Can you please discuss your evaluation of these issues?

A. Yes. I have previously addressed these issues in homeowners, mobile homeowners and dwelling insurance rate filings in North Carolina, where I have recommended that the indicated rates be developed to include the net cost of reinsurance. I will briefly outline the problem and then discuss each of the issues separately.

To begin with, dwelling extended coverage is one of several types of coverage that are subject to the potential for catastrophic loss. In such coverages (homeowners, earthquake, allied lines and other property coverages), individual catastrophic events can result in enormous losses, far in excess of what the typical insurer could bear. Thus, in these lines of business, insurers routinely purchase reinsurance to manage their exposure to extreme events, and it is appropriate to provide for the cost of this reinsurance in setting rates for these lines of insurance. Since ratemaking is often done on a direct basis, as compared to a net of reinsurance basis, an explicit adjustment must be made to provide for the cost of reinsurance.

Second, the exposure to catastrophic loss varies substantially by territory within North Carolina. It is well known that the coastal counties in the state are subject to severe exposure to the hurricane peril, while the interior regions to the west are subject to considerably less exposure. Since the need for reinsurance is a function of the degree of catastrophe exposure, the cost of reinsurance should reflect such territorial differences as exist within the state. Accordingly, in considering the cost of reinsurance in primary rates, the statewide cost should be allocated across territories, proportional to risk.

Q. You mentioned that direct ratemaking does not include the cost of reinsurance. Can you please explain?

A. Yes. Direct ratemaking is an approach that is sometimes used when making insurance rates on an industrywide basis (where the terminology "direct" refers to an analysis done without consideration of reinsurance). While this approach is reasonable for some lines of insurance (such as auto insurance), it fails to reflect the market realities associated with writing property insurance in catastrophe prone environments such as North Carolina. In these environments, primary insurers are required to purchase reinsurance to manage their exposure to catastrophe risks, and such reinsurance comes at a substantial net cost.

Q. Why does reinsurance come at a substantial net cost?

A. Reinsurers generally cover the riskiest portion of the insurance loss distribution – the events that occur only rarely but impose extremely high costs. In order to provide a credible promise to pay claims resulting from extreme events, reinsurers carry substantially more capital per unit of exposure than primary insurers. This capital has a cost, which is included in the premiums paid for the reinsurance in the market. Since basic economic and actuarial principles require all costs of the risk transfer to be included in the price of insurance, and since reinsurance is required to efficiently manage catastrophe risk, its net cost should be included in the rates charged for property insurance.

Q. How has the North Carolina Rate Bureau (NCRB) addressed the issue of reinsurance in previous property insurance rate filings?

A. For more than a decade, the NCRB has included a provision for the net cost of reinsurance (NCOR) in property insurance rate filings. That provision was based on a procedure I developed which estimated the net cost of reinsurance as an expense to be included in the direct property insurance rates in North Carolina. (By net cost of reinsurance, I mean the expense and profit components of the reinsurance rate, since the loss costs are already included in the calculation of the direct premium.) This procedure is conceptually identical to that employed in Florida, where insurers make rates using direct losses and expenses, but then add in a provision which covers the cost (to the primary insurer) of the reinsurer's profit and expense.

Q. Can you please describe the analysis you conducted to estimate the NCOR in previous rate filings?

A. Yes. To estimate the NCOR, I adopted the standard ratemaking assumption used in North Carolina – i.e., that there is a single aggregate company that is the composite of all carriers in the state. I then assumed that this company maintained a reinsurance program that is typical of property insurers writing in hurricane prone states such as North

Carolina, and based on the program assumptions and the modeled hurricane losses, I estimated a "competitive market" reinsurance premium. This was an estimate of the amount reinsurers would charge to provide the single aggregate company in North Carolina with reinsurance coverage consistent with the assumptions I made regarding the nature of the reinsurance program.

Q. Has the NCRB adopted the same procedure in this case?

A. No. In the most recent Homeowners insurance rate decision in North Carolina, the Commissioner gave no weight to my testimony on this issue, despite the fact that I have spent more than a decade developing and refining the analysis of the reinsurance cost to be included in primary property insurance rates. Therefore, for this filing the NCRB has retained Aon Benfield, the world's largest reinsurance broker, to provide the estimate of the NCOR for use in the current filing. This is a change I strongly support: if the Commissioner's concerns regarding the estimate of NCOR had to do with the experience of the analyst, those concerns must be eliminated by the use of Aon Benfield for this purpose. There can be no doubt that the individuals responsible for managing the property catastrophe reinsurance function at the world's largest reinsurance broker are among the people best positioned to estimate an appropriate provision for reinsurance in this case.

Q. Although Aon Benfield is providing the estimate of the NCOR for use in this filing, is it true that the NCRB requested you to update your own NCOR analysis for the filing as well?

A. Yes; I believe the NCRB wanted to compare the results of my methodology to those produced by Aon Benfield (which are based on methods and data that are different than the ones I used in the past). To do so I estimated the NCOR using the exact same methodology I relied upon in the past, with several changes in assumptions and data sources based on information provided by Aon Benfield regarding the current reinsurance market. I had similarly relied on such information from Aon Benfield in recent cases. (Also, in order to make an "apples to apples" comparison between my results and Aon Benfield's, both our estimates must be based on the same reinsurance program assumptions and the same underlying modeled loss data.) In my opinion this makes perfect sense – Aon Benfield is in the market on a daily basis, placing property catastrophe reinsurance on behalf of scores of clients, and hence can be relied upon to have the most accurate current information regarding the types of reinsurance purchased and the current market prices for that coverage.

The specific changes in assumptions that I made, to be consistent with Aon Benfield, were as follows:

- In the past, I assumed an attachment point equal to the one in ten year hurricane loss event (i.e., the 90th percentile of the statewide loss distribution), and an

exhaustion point equal to the one in a hundred year event (the 99th percentile of the statewide loss distribution). Based on Aon Benfield's input, those assumptions were changed to a higher attachment point ($350 million, or approximately a 1 in 14 year event) and a higher exhaustion point ($2.35 billion, or approximately 1 in 227 year event).

- In the past I assumed a 5% coparticipation in the reinsured layer. (Coparticipation refers to a provision where the primary insurers share a specified percentage of the reinsured loss). Based on Aon Benfield's input, that was changed to a 0% co-participation.

- In the most recent several property filings I assumed a reinsurer required return on equity of 11%, which was roughly the midpoint of the cost of capital range provided by Dr. Vander Weide. Given that Dr. Vander Weide's range had declined somewhat (the midpoint is now 10.4%), and given Aon Benfield's view that reinsurer capital costs are relatively low in the market today, I reduced the required return to 10%.

- In all previous filings, modeled hurricane losses, and all the analyses derived therefrom, were based solely on the AIR model. Consistent with legislation that will become effective in North Carolina, in this case Aon Benfield has provided and blended modeled results from two vendors, AIR and RMS.

Given the parameters of the reinsurance program described above, and the AIR and RMS loss distributions, I determined the amount of losses that would be subject to reinsurance coverage as a share of the total hurricane losses in the state. Based on the projected reinsured losses, I then developed a "competitive market" reinsurance premium, following a series of steps that are described below. Before describing the individual steps in that process, however, I should note two considerations in connection with the use of the hurricane models in this filing.

First, in developing the hurricane loss estimates for use in this filing, Aon Benfield ran two alternative versions of the AIR and RMS models. The first one relies on the full 100+ year history of hurricane activity as the basis for projected hurricane frequency and severity, and is known as the Historical (HIST) RMS model, or the Standard (STD) AIR model. The alternative version, which reflects the known cyclicality of hurricane activity and the higher frequency and severity of hurricanes in periods of warmer sea surface temperatures, is termed the Medium Term Rate (MTR) RMS model, or the Warm Sea Surface Temperature (WSST) AIR model.

When calculating the base rates for this filing, the NCRB relied upon the HIST/STD versions of the two model to estimate the level of hurricane losses to be included in the rates. However, reinsurers today rely on models that use higher hurricane frequencies and/or severities to estimate expected losses for property exposures, to reflect the widespread recognition that we are currently in a phase of increased activity in the hurricane cycle. It is appropriate, when estimating a provision for NCOR, to rely on the

models used in the market to set the price of reinsurance, hence I relied on the MTR/WSST versions of the two models to develop loss estimates in this portion of my analysis.

Second, I also note that when projecting losses using either model, the estimates reflect the phenomenon of "demand surge." Demand surge refers to the fact that, subsequent to the occurrence of a large natural catastrophe, the prices of labor and materials required to repair or replace damaged property tend to increase because of the surge in demand for such resources. This is exactly what one would expect given the underlying dynamics of supply and demand; with resources (particularly labor) that are relatively fixed in supply in the short run, a rapid increase in demand is expected to increase prices. This phenomenon has been observed following natural disasters such as Hurricane Andrew, the Northridge earthquake, Hurricane Katrina and the like. In estimating the damages attributable to catastrophic events, it is appropriate to include all factors that affect the level of expected losses, including, of course, factors that affect the price of the resources required to respond to those events.

Given the reinsurance program described above and the RMS/AIR loss distributions, I then determined the amount of losses that would be subject to reinsurance coverage, as a share of the total hurricane losses in the state. Based on the projected reinsured losses, I then developed a "competitive market" reinsurance premium, as follows:

- I loaded the reinsured loss for loss adjustment expense (LAE), using an assumption, provided by Aon Benfield, that LAE is typically 6% of incurred loss for hurricanes.

- I then loaded the incurred losses and LAE for assumed reinsurer expenses, using an expense factor which results in a reinsurer expense provision equal to 16.2% of premium.

- I assumed the reinsurer set an underwriting profit provision that would yield a return on net worth, after consideration of all investment income, of 10.0%. I determined the reinsurer's net worth such that the reinsurer premium to surplus ratio would be .30, a selected value that approximates the historical average ratio for professional reinsurers from Best's Aggregates and Averages over the past several years.

Having determined the reinsurance premium that a competitive reinsurance market would produce under the assumptions described above, I then subtracted expected losses and LAE from the premium to leave the net cost of reinsurance of $74,757,678.

Q. Are the results of your calculations shown in an exhibit?

A. Yes. Exhibit RB-16 shows the calculations giving rise to the estimated net cost of reinsurance of $74,757,678. This exhibit shows the derivation of the reinsurance premium, based on the portion of hurricane losses that are covered by reinsurance, and

the reinsurer's capitalization and required return. The end result of that calculation is the net cost of reinsurance, in dollars. To be explicit, the net cost of reinsurance is the total reinsurance premium less the amount of hurricane losses and LAE that are recovered from the reinsurer but already included in the base rate. The amounts recovered from the reinsurer that are already in the base rates must be subtracted, to assure that those costs are not double counted when setting the statewide premiums for property insurance.

Q. In your opinion, it is appropriate to include the net cost of reinsurance in property insurance rates in North Carolina?

A. Yes. Insurers in North Carolina incur a substantial cost for bearing the risk of catastrophe exposed property insurance in the state. The market cost of bearing that risk (whether the risk is retained by the insurer or transferred to a reinsurer) must be included in the rates. Since this is a legitimate cost of the risk transfer inherent in the purchase of property insurance, it should properly be included in the rates.

Q. How do your estimates of the NCOR compare with those of Aon Benfield?

A. Our estimates are extremely close, differing by less than 1%, despite the fact that we used fundamentally different methodologies for estimating the NCOR. This gives me great confidence that the methodology I developed for pricing reinsurance more than a decade ago is reasonable and produces accurate results.

Q. In previous property rate cases, you allocated the net cost of reinsurance across regions in the state proportional to risk. Did you perform a similar analysis in this case?

A. No, I did not. Since the need for reinsurance arises from catastrophe exposure, which varies dramatically across the state of North Carolina, regional differences in risk should be taken into account when determining the allocation of reinsurance costs within the state. In previous years the appropriate committees at the NCRB determined that the NCOR should be allocated proportional to risk, but decided to use a regional allocation process, where the NCOR was allocated to 3 (or in the most recent property rate case 4) distinct regions in the state. This year the NCRB determined that it would be appropriate to allocate the NCOR at the same level of granularity as the other cost elements in the filing, and hence it requested Aon Benfield to provide the NCOR at the territorial rather than the regional (or zone) level.

Q. In your opinion, is it appropriate to allocate reinsurance costs proportional to risk?

A. Yes. It is both intuitively and empirically obvious that the relative risk of property insurance varies geographically. As such, the cost for bearing that risk should be allocated proportional to the measurement of risk. Aon Benfield's process of allocating

the NCOR to territory is consistent with the objective of producing rates that are fair, reasonable and not unfairly discriminatory across policyholders.

Q. Does this methodology result in a higher overall cost than would have been the case without the allocations?

A. No, it does not; the allocation method itself is simply a manner in which to spread the costs across policyholders consistent with risk. Thus, it does not impose any additional costs on North Carolina policyholders in the aggregate; rather it just apportions the costs in a manner that is consistent with the risks different policyholders impose.

V. COMPENSATION FOR RISK OF ASSESSMENTS FROM BEACH/FAIR PLANS

Q. You said earlier that you also considered the risks faced by insurers in North Carolina associated with the exposures insured in the Beach/Fair Plans. Can you please explain this issue?

A. Yes. In addition to the risks attendant to the property insurance directly written by insurers in North Carolina, there is substantial additional risk to insurers attributable to the exposures insured in the Beach/Fair Plans.

The Beach/Fair Plans serve as the so-called "residual market" for residential property insurance in the state. Residual markets exist to provide access to insurance coverage for policyholders who cannot obtain such coverage from insurers in the voluntary market. In states which have significant exposure to catastrophes, property insurance residual markets often grow to represent a very sizable portion of the total insured risk in the exposed regions of the state.

The Beach/Fair Plans provide either wind only or full residential property insurance coverage to North Carolina policyholders. The Plans use the premium from those policies to fund the future losses and expenses attributable to the coverages they write (including the purchase of reinsurance, issuance of catastrophe bonds and the like). The Beach/Fair Plans can accumulate surplus and that surplus is available to pay losses in the event that the losses exceed collected premiums plus investment income. However, if their surplus is exhausted, then additional losses (up to a $1 billion limit for the Beach Plan but unlimited for the Fair Plan) are passed through to all insurers in the state in the form of assessments based upon each insurer's total property writings in North Carolina. (Beyond the $1 billion limit, and any applicable reinsurance, additional losses in the Beach Plan are passed through directly to policyholders statewide.) Even if an insurer does not write property insurance in North Carolina's beach and coastal areas, it is

nevertheless subject to any assessment by the Beach/Fair Plans due to its writings in other areas of North Carolina.

Although the size of the Beach Plan has stabilized in the most recent several years, it still represents a significant exposure for insurers, due to its past growth. That growth in the Beach Plan was attributable to numerous factors, including the expansion of the Beach Plan territory, the addition of homeowners coverage to the coverages available in the Beach Plan, the increase in the number and value of insured properties in the beach and coastal areas of North Carolina, and the inadequacy of primary property insurance rates in the state.

This risk of assessment is real and substantial, and insurers must be compensated for this additional risk to their capital. To address this situation, I have developed a procedure to incorporate a provision in the rates that compensates insurers for this risk.

Q. Can you please explain the procedure you developed?

A. Yes. The model I developed for this purpose involves two steps; the first is to quantify the magnitude of the exposure itself, and the second is to determine the fair compensation to be paid to insurers for bearing that risk.

To quantify the magnitude of the exposure, it was necessary to estimate the expected value of the assessments on insurers that arise because of catastrophic losses in the Beach/Fair Plans. Since assessments on insurers arise only after the plans have exhausted other resources available to pay losses, I needed to determine both the probability of that occurring as well as the amount by which the losses exceeded those other resources. Therefore, I obtained information from the Beach and Fair Plans regarding the reinsurance program in place for the 2016 storm season, along with assumptions of each plan's accumulated surplus available for the season as well – i.e., the "other resources" that would be available to pay for hurricane losses during the 2016 storm season. I then obtained the AIR/RMS hurricane model runs used by the Beach/Fair Plans, and for each iteration of the models I determined the amount of losses that would be covered by reinsurance and the remaining losses that would have to be funded either from the plans' accumulated surplus, through assessments on property insurers in the state, or ultimately through assessments on North Carolina property insurance policyholders. I then subtracted the accumulated surplus of the plans from the losses remaining after reinsurance, limited the assessable losses due to Beach Plan exposures to $1 billion, and calculated the average assessment on property insurers across all iterations of the model (which is the expected value of the losses that would have to be funded through assessments on North Carolina property insurers).

As noted, this is a measure of the magnitude of the exposure – i.e., it represents the risk to insurers' capital associated with the exposure to Beach/Fair Plans assessments. The next step is to develop a method of measuring the fair compensation to insurers for bearing this risk.

Q. Can you please explain how you measured the compensation for bearing this risk?

A. Yes. To measure the fair compensation for bearing this risk, I relied on data regarding the market price of catastrophe risk, taken from the market for insurance linked securities. Insurance linked securities (ILS) are securities (bonds, warrants and the like) that have conditional payoffs that are virtually identical to reinsurance. Investors purchase such securities at significant yield premiums to risk free bonds, because they are exposed to loss of principal and interest if certain "insured events" occur.

Q. Can you explain how such securities work in practice?

A. Certainly. As an example, consider an insurer that issues $100 million of a bond with a provision that, for every dollar of loss from an Atlantic hurricane in excess of $1 billion, one dollar of the bond would not have to be repaid. Since the investor in that bond would effectively be paying for up to $100 million of hurricane losses, such a security would be the functional equivalent of a reinsurance contract that provides $100 million in coverage excess of a $1 billion attachment point.

Now, with respect to the interest to be paid by the insurer on this bond, assume investors demand a premium of 10% in excess of the risk free rate in order to purchase such a security (because of the high degree of risk associated with the potential loss of principal and interest). This risk premium implies that the insurer would have to pay $10 million in interest in excess of the risk free rate to induce investors to purchase such securities, which is equivalent to paying a premium of $10 million for $100 million of reinsurance. This kind of information can be very illuminating in connection with evaluating the risk premiums required to bear catastrophe risk.

Q. What kind of information is available in these markets that can help you to assess the fair compensation for bearing catastrophe risk?

A. Markets for ILS have been growing in recent years, as they provide a financially efficient method of transferring risk. While smaller than reinsurance markets, they can provide extremely useful data about the cost of risk, because they reflect estimates of the pure cost of risk transfer, unencumbered by insurance specific issues (such as expenses, capital requirements, required returns, regulation and the like).

Lane Financial, LLC is a firm that specializes in and is the most prominent analyst of insurance linked securities. In April of each year, Lane publishes a data base that accumulates a variety of useful information that can help to evaluate the fair compensation for bearing catastrophe risk. For each ILS in the market, Lane publishes the following data: the yield on the security; the excess return over LIBOR (the risk free rate); the probability that the security will suffer a loss; and the expected value (or

average) loss anticipated on the security. These data provide the foundation for my analysis of the proper compensation for bearing the risk of Beach/Fair Plans assessments.

Q. How are these data used to determine the compensation for assessment risk?

A. Before describing the mechanics of the analysis, I first define several terms that will prove useful in this discussion. The "*yield spread*" is simply the difference between the yield on the particular ILS and LIBOR. (LIBOR, or the London Interbank Offered Rate, is one traditional measure of the risk free rate in finance.) For example, in the case I cited above (where a $100 million bond had a provision that, for every dollar of hurricane loss in excess of $1 billion, one dollar of the bond would not have to be repaid) investors demanded a premium of 10% in excess of the risk free rate. In that case, the yield spread was 10% (or 1000 basis points), which implies that the insurer would have to pay $10 million in interest in excess of the risk free rate to induce investors to purchase such securities.

Now assume that the expected distribution of hurricane losses is such that this security had an average annual loss of $1 million, meaning that, based on the probability and amount of hurricane losses of varying sizes, an investor would anticipate having an average loss of $1 million per year. This is termed the "*expected loss*." Since the investor in this example receives compensation of $10 million in excess of the risk free rate for bearing the risk of loss, the "expected profit" to the investor is $9 million (the yield in excess of the risk free rate minus the expected losses).

Finally, I define a term known as the "*profit multiple*," which is the ratio of expected profit to expected loss – in this case $9 million divided by $1 million, or a profit multiple of 9.0. The profit multiple provides an estimate of the compensation investors require to bear catastrophe risk, insofar as it tells us what returns investors require in order to take on the risk of loss from a catastrophic event. One particularly important feature of this variable is that it is a measure of compensation per dollar of expected loss; given the Beach/Fair Plans assessments to which insurers are exposed, the profit multiple can be used to develop an estimate of the fair compensation for bearing such risk. This is the measure of risk I rely upon in evaluating the fair compensation for property insurers whose capital is exposed to Beach/Fair Plans assessments.

Q. Before you explain exactly how you used this information, is it true that all ILS have yield spreads that are 10.0 times, or profit multiples that are 9.0 times, their expected loss?

A. No. This value fluctuates depending on the risk characteristics of the particular securities in question. In my example there was a bond with an attachment point of $1 billion and an expected loss of $1 million, but each of the securities traded in capital markets has different attachment points and amounts of coverage, and different probabilities and amounts of expected loss. As you would expect, those securities that have more volatile

exposures have larger risk premiums relative to expected loss than those with less volatility.

Q. Generally speaking, which securities are more volatile, and hence have higher risk premiums and profit multiples?

A. For exposures such as these, securities that have "higher" attachment points – meaning those which have a lower probability of incurring a loss – have greater volatility and larger risk premiums. While it is true that such securities have a lower probability of incurring a loss, it is also the case that the variability of the losses on such securities is greater than those with a higher probability of incurring a loss (i.e., those that attach at lower points on the loss distribution). As a result, ILS's with very low probabilities of attachment will have the highest risk premiums and profit multiples.

Q. How do you use the data on ILS's to develop the fair compensation to insurers for bearing the risk of Beach/Fair Plans assessments?

A. First, to get a more precise estimate of the risk premia in capital markets, I compiled the data on profit multiples for all ILS's issued on U.S. catastrophe exposures in the last ten years. However, as I mentioned earlier, each ILS has a different profit multiple based on its specific risk characteristics. Therefore, to determine the profit multiples that are appropriate for the risks imposed by the Beach/Fair Plans exposures, I fit a curve which relates the profit multiple on each bond to the probability of loss occurring on that bond. This curve permits the measurement of profit multiples at any probability level

Next, I obtained information from the Beach/Fair Plans on the distribution of hurricane losses, based on the AIR and RMS hurricane model runs using the most current exposures for the plans. For each iteration of the models, I estimated the hurricane losses that would be ceded to reinsurers (using the actual reinsurance purchased by the Plans for the 2016 storm season) and the amount of those losses that would be retained by the Beach/Fair Plans. Based on this analysis I was able to determine the expected value of hurricane losses retained by the Beach/Fair Plans, as well as the distribution of those losses within the various probability layers.

Finally, to determine the fair compensation for bearing this risk, I determined the amount of losses that would exceed the Beach/Fair Plans' capacity, and thus would be assessed to voluntary insurers in the state. For each dollar of such assessments, I multiplied the expected loss by the appropriate profit multiple (given the probability interval in which the losses reside). The product of the expected losses by interval or layer and the appropriate profit multiple for the layer represents the fair compensation insurers should receive for bearing such risk.

Q. Have you developed any exhibits that provide the details of these calculations?

A. Yes. Exhibit RB-17 contains ten pages of information required to develop the fair compensation for bearing Beach and Fair Plan assessment risk.

Pages 1 and 6 of Exhibit RB-17 show a summary of the Beach and Fair Plan's reinsurance programs for the 2016 storm season, including the various layers of reinsurance purchased and the coverage levels within those layers. Although the Beach and Fair Plan are separate legal entities, in previous years they purchased reinsurance contracts that covered the combined loss of both entities. This year the two Plans purchased separate reinsurance contracts.

Page 2 shows the curve I fit to the ILS profit multiples based on all ILS issued in the last ten years, and the equation of the fitted curve that is used to determine the profit multiples for each layer to which insurer capital is exposed.

Pages 3 and 7 display the profit multiples calculated for each layer of the Beach and Fair Plan's loss distribution, based on the equation on page 2. In order to determine the fair compensation to voluntary insurers for bearing the risk of assessments, I need to determine which layers contain losses that will be funded by such assessments, and the appropriate compensation per dollar of expected loss within those layers. The profit multiples are the appropriate compensation per dollar of expected loss in each layer.

Pages 4 and 8 illustrate how potential losses for the Beach Plan Residential Account and Fair Plan are funded. (The Beach Plan determines losses and assesses voluntary insurers separately for each account, while the Fair Plan has only one account.) The Beach Plan can assess voluntary insurers a maximum of $1 billion for any deficits resulting from a single calendar year across all accounts, while the Fair Plan assessments are unlimited. Any amounts needed to pay claims in excess of the assessable amounts are to be collected through surcharges to property insurance policyholders statewide.

The mechanics of the funding analysis are as follows. First, for each iteration of the models, losses are segregated into loss layers separately by account (Beach Plan Residential, Beach Plan Commercial, and Fair Plan). Then, the losses by layer for each account are disaggregated based on the source of funding for those losses - Beach/Fair Plan surplus, the next $1 billion of Beach Plan losses to be covered by assessments on voluntary insurers, private reinsurance and ultimately any additional amounts in the Beach Plan to be covered by surcharges on property policyholders' premiums. Finally, the losses associated with each event are then accumulated in these categories for each of the loss layers. (Although I apply the reinsurance contracts and the $1 billion limit to commercial losses, no expected commercial hurricane losses are included in my calculations of the fair compensation for exposure to assessments for residential lines of business.)

While pages 4 and 8 illustrate the funding of potential losses within each layer, the purpose of this analysis is to determine the fair compensation for the risk of assessments on private insurers. As such, the analysis must take into account the probability of losses

occurring within each layer and calculate the expected value (or annual average) loss that will be borne by private insurers. Pages 5 and 9 of RB-17 provides that analysis; they show the expected value of the losses that would be covered by the Beach Plan Residential and Fair Plan accounts, and the annual average amount of those losses that would be assessed to private insurers. In addition, these pages display the profit multiples associated with each layer of the loss distribution, and the product of the indicated profit multiple times the expected losses within the layer. The sum of those values is the indicated compensation for assessment risk for each account. (For example, the total cost of providing reinsurance to the Beach Plan Residential Account is $66.94 million.)

The final step in this calculation is to determine the appropriate provision to be included in the rates to compensate insurers for the risk of Beach and Fair Plans assessments. This provision, expressed as a percent of premium, is developed on page 10 of Exhibit RB-17. (I note that these calculations reflect only the residential portion of the Plans' deficits.) Since assessments for Beach/Fair Plans losses are applied to all property insurance lines in the state, the bottom table on Exhibit RB-17, page 10 shows the development of a charge that will produce an amount of revenue equal to the total required compensation of $106.70 million. As shown therein, that charge amounts to 3.6% of total property insurance premium in the state.

Q. In your opinion, is it appropriate to include the 3.6% compensation for assessment risk provision in property insurance rates in North Carolina?

A. Yes, not only is it appropriate, it is necessary in order that the rates are fair and reasonable to insurers. Since insurers are exposed to the risk of Beach/Fair Plans assessments as a result of writing voluntary market property insurance in the state, they are entitled to receive fair compensation for bearing that risk. The model I have developed relies on a well established and widely accepted measure of compensation to determine a provision that will fairly reward insurers for bearing this additional risk to their capital.

VI. PROJECTED RETURN ATTRIBUTABLE TO INSURANCE OPERATIONS

Q. Earlier you said that you had calculated the statutory return insurers would expect from underwriting dwelling insurance in North Carolina. Have you conducted such an analysis?

A. Yes, I have. I developed a model using traditional insurance profitability analyses and have calculated the statutory returns on equity that would be expected to arise assuming that actual underwriting and investment results materialize exactly as projected in this filing. The results are contained in Exhibits RB-18 and 19 filed with this testimony.

Q. What do you mean when you use the term pro forma in that exhibit in connection with rate of return?

A. I use this term to indicate that the rate of return presented in these exhibits is based on a series of assumptions regarding such inputs as underwriting profit, investment gain, leverage and the like. If these assumptions actually materialize, then the "pro forma" rates of return calculated in the exhibits will prevail. However, to the extent that these assumptions are not realized, the rate of return will differ from that calculated in the exhibits.

Q. Can you please now describe the components of the model you developed?

A. Yes. The model really consists of a single page that calculates the rate of return on equity attributable to undertaking the insurance activity. It sets forth estimates of income derived from underwriting, installment fees and investment of reserves and estimates of costs, comprised of losses, expenses and taxes. This exhibit is supported by several other exhibits which provide calculations of investment yield rates, tax rates, premium to surplus and net worth to surplus ratios, and installment fee income.

Q. Can you now please describe the principal elements of the rate of return analysis?

A. Yes.

1. Underwriting profit is the difference between earned premiums and projected incurred losses and expenses. This provision was selected by the appropriate committees of the Rate Bureau.

2. Installment fee income is projected based on historical installment revenues, taking into consideration the most recent information on the installment fee program.

3. Taxes are calculated assuming that the regular corporate tax rate applies to statutory underwriting (plus installment fee) income, and that an additional tax liability applies due to the reserve discounting and revenue offset provisions that are applicable to property casualty insurers. Taxes on investment income are calculated assuming that the current statutory tax rates apply to the various classes of investment income earned.

4. Investment gain on the insurance transaction is estimated as the product of an investment yield rate and the investible funds available from loss, loss adjustment expense and unearned premium reserves (i.e., policyholder supplied funds). The investment yield rate is derived as the average of the "embedded yield" and the "current yield," based on the actual portfolios of

securities held by insurers. This estimated yield rate includes income from interest, dividends, real estate, and other assets, as well as realized capital gains. The investible funds in this calculation are estimated using the well known ISO State-X model, with one modification as described below.

Q. In previous testimony in North Carolina, you identified certain changes you made to the traditional rate of return analysis that is performed using this model. Did you continue these changes for this year's filing?

A. Yes. I removed the reduction of investible funds by the amount of agents' balances from the ISO State-X calculation. However, it continues to be true that the funds represented by agents' balances are not available for investment by insurers. Therefore, in the rate of return calculation, the investment income from this modified State-X calculation is reduced by the investment income attributable to agents' balances. This calculation recognizes (1) that the majority of agents' balances represent premiums not yet paid by insureds because of installment payment plans, and hence is unavailable for investment and (2) that for the small minority of agents' balances that is premiums collected by agents but not yet remitted to the companies, the investment income on that premium is additional compensation to the agents and a cost to the companies as part of the insurance transaction.

In addition, I adjusted the trended loss, LAE and fixed expense ratios to reflect the proposed rate change. That is to say, I have divided the trended loss and expense ratios at present rates by one plus the proposed rate change to reflect the change in these ratios that occur when rates are changed.

Q. Could you please clarify how the underwriting profit provision contained in the rate filing was determined?

A. Yes. The issue of how the Rate Bureau determines the underwriting profit and contingency factor has routinely arisen in rate hearings in North Carolina over the past several years. Although it is evident from my exhibits that the Rate Bureau selects an underwriting profit and contingency provision to be included in the rates, there has been lengthy cross examination on this issue in every rate hearing in recent memory. Therefore, to clarify this matter, I will briefly discuss the procedure used by the Rate Bureau to determine the underwriting profit and contingency factor that is included in the proposed rates.

As part of the process of preparing a property insurance rate filing, the Property Rating Sub-Committee of the Rate Bureau meets to review data and determine values for a number of the important components of the proposed rates. One of these components is the underwriting profit factor. To determine this value, a procedure is followed in which I provide the committee with the estimated returns on equity (both statutory returns as well as returns adjusted to include investment income on surplus) associated with alternative underwriting profit provisions, and the committee then selects a provision

after considering the cost of capital that has been developed by Dr. Vander Weide. Thus, the process is best described as one in which I test alternative underwriting profit provisions, and the committee selects a value based on these tests.

Q. How do you know what values of the underwriting profit provision to test?

A. I have been performing this type of analysis on behalf of the Rate Bureau for many years, and I am quite familiar with the dynamics of these models. Therefore, it is relatively easy to know the general range of values around which the underwriting profit is likely to fall. Normally, I will select approximately five or six values of the underwriting profit provision to test, that comprise a range of perhaps two to three percentage points, and the committee typically selects a value within that range. (For example, for this filing, I believe I tested underwriting profit provisions for dwelling insurance in one half percentage point increments ranging from 9.5% to 12.5%, and the committee selected a value of 10.5% for each line.) Of course, if the committee is not satisfied with the range of values I propose, I provide the returns associated with alternative values proposed by the committee.

Q. From what you've said, it appears that the Rate Bureau *selects* an underwriting profit provision, rather than *deriving* such a provision from the cost of capital. Is that correct, and if so, isn't it true that actuarial standards of practice require that the underwriting profit provision be *derived* from an underlying cost of capital?

A. It is correct that the Rate Bureau committee selects an underwriting profit provision and then tests whether that provision results in an expected rate of return on net worth that is consistent with the cost of capital. However, despite what has been suggested in the past by DOI witnesses, it is *not true* that actuarial standards of practice require that an underwriting profit be derived from the cost of capital. In fact, that issue is addressed explicitly in Actuarial Standard of Practice #30, entitled "Treatment of Underwriting Profit and Contingency Factors and the Cost of Capital in Property/Casualty Insurance Ratemaking." Section 3.1 of that ASOP states the following:

> <u>Estimating the Cost of Capital and the Underwriting Profit Provision</u> – Property/casualty insurance rates should provide for all expected costs, including an appropriate cost of capital associated with the specific risk transfer. This cost of capital can be provided for by estimating that cost and translating it into an underwriting profit provision, after taking leverage and investment income into account. Alternatively, the actuary may develop an underwriting profit provision and test that profit provision for consistency with the cost of capital. The actuary may use any appropriate method, as long as such method is consistent with the considerations in this standard.

The procedure utilized by the Rate Bureau is exactly the approach articulated in this section (i.e., “the actuary may develop an underwriting profit provision and test that profit provision for consistency with the cost of capital”).

Q. Could you please clarify how you selected your investment yield rate and premium to surplus ratio?

A. Yes. To select the investment yield rate, I was asked by the Rate Bureau to compute the average of what are known as the "embedded" and "current" yields, where each was based on the actual asset portfolios insurers currently hold. There has been a long-standing debate regarding the choice between embedded and current yields in insurance profitability calculations. Since the Commissioner himself adopted an approach of averaging the embedded and current yields in his 1994 automobile decision (and in his decision in the 1996 case, he selected a yield which approximated the yield obtained from this approach), the Rate Bureau has chosen to follow that methodology since that time.

To estimate the embedded yield, I calculated the ratio of investment income divided by average invested assets and added to that an estimate of the ten year average ratio of realized capital gains to invested assets. The sum of these two is the estimated embedded yield.

To estimate the current yield, I determined the yields available in today's capital markets for the portfolio of securities currently held by the property-casualty insurance industry. I then calculated a weighted average of these yield rates based on the proportion of assets held by the industry in each of the various securities such as stocks, bonds, real estate and the like.

As far as the premium to surplus ratio is concerned, I also relied on information which reflects the actual degree of leverage for insurers writing dwelling insurance in North Carolina. The premium to surplus ratio I used is the ten year average premium to surplus ratio for the top 30 company groups which wrote dwelling insurance in North Carolina in each of those years.

Q. Can you please provide the results of your calculations regarding the projected rate of return to the insurance transaction if your underlying assumptions are realized?

A. Yes. I estimate that insurers in North Carolina should expect to earn statutory returns on net worth of 7.7% for dwelling fire insurance and 6.6% for dwelling extended coverage insurance in North Carolina. In addition, the total return on net worth (i.e., including investment income on surplus) is 9.9% for dwelling fire and 9.1% for dwelling extended coverage. While the statutory returns are well below the lower bound of Dr. Vander Weide's range for the cost of capital, the total return falls within (albeit at the lower end of) that range.

Q. Are there any factors that might impact the realization of these projected returns?

A. Yes. In order for the aggregate industry to achieve the returns projected in these exhibits, every assumption in the model must be realized exactly. However, even if every other projection in the filing is exactly realized, the industry will still not realize these projected returns because the filing does not reflect the current surplus position of the aggregate industry. For the sake of stability in the ratemaking process, the premium to surplus ratios used in my calculations are based on long term historical data. The most recent data show that the aggregate industry writing dwelling insurance in North Carolina has more surplus in relation to premiums that the historical averages used in my calculations. Therefore, even if all other assumptions were realized exactly, the calculated rate of return would overstate the returns the aggregate industry would reasonably expect.

Q. In previous property insurance filings you have recommended regional allocations of profit, similar to your allocation of NCOR. Have you done so in this case?

A. No. In order to minimize areas of dispute between the NCRB and the North Carolina DOI, the appropriate committees at the Bureau decided for this filing to use the traditional approach of setting a single underwriting profit factor that applies uniformly throughout the state. Therefore I was not asked to perform any analyses to allocate profit to region or territory.

VII. CONCLUSION

Q. Based on the studies and analyses you have performed, have you come to any conclusions regarding the provisions for underwriting profit provision, net cost of reinsurance, and compensation for assessment risk that have been filed by the Rate Bureau as part of the filing in this case?

A. Yes. Based on my evaluation of Dr. Vander Weide's cost of capital estimates, my consideration of insurer specific risk characteristics, and my estimation of projected and expected returns, I believe that the filed underwriting profit provisions comply with North Carolina law and that the returns expected to be realized by insurers will not be excessive. In addition, based on my analyses of the cost of reinsurance and the required compensation for the risk of Beach/Fair Plan assessments, I believe that the provisions for the net cost of reinsurance and the required compensation for assessment risk in the filing are both reasonable and not excessive. Finally, assuming that the actuarial estimates in the filing are reasonable, it is my opinion that including the filed underwriting profit provision, net cost of reinsurance provision, and compensation for assessment risk provision will produce rates that are just, reasonable and not excessive, inadequate or unfairly discriminatory.

Q. Does this conclude your testimony?

A. Yes, it does.

(12)	Reinsurer Expenses plus Cost of Reinsurer Capital [(10) + (11)]	74,757,678

Notes:

(1), (2), (3) from Simulation.
(2) Assumes hurricane losses reinsured from $350 million to $2,350 million.
(4) Judgment based on Professional Reinsurers Expenses.
(6) Milliman Analysis.
(7) Underwriting return that produces reasonable after-tax return on surplus.

NCIUA - North Carolina Beach Plan

Summary of 2016 Catastrophe Reinsurance

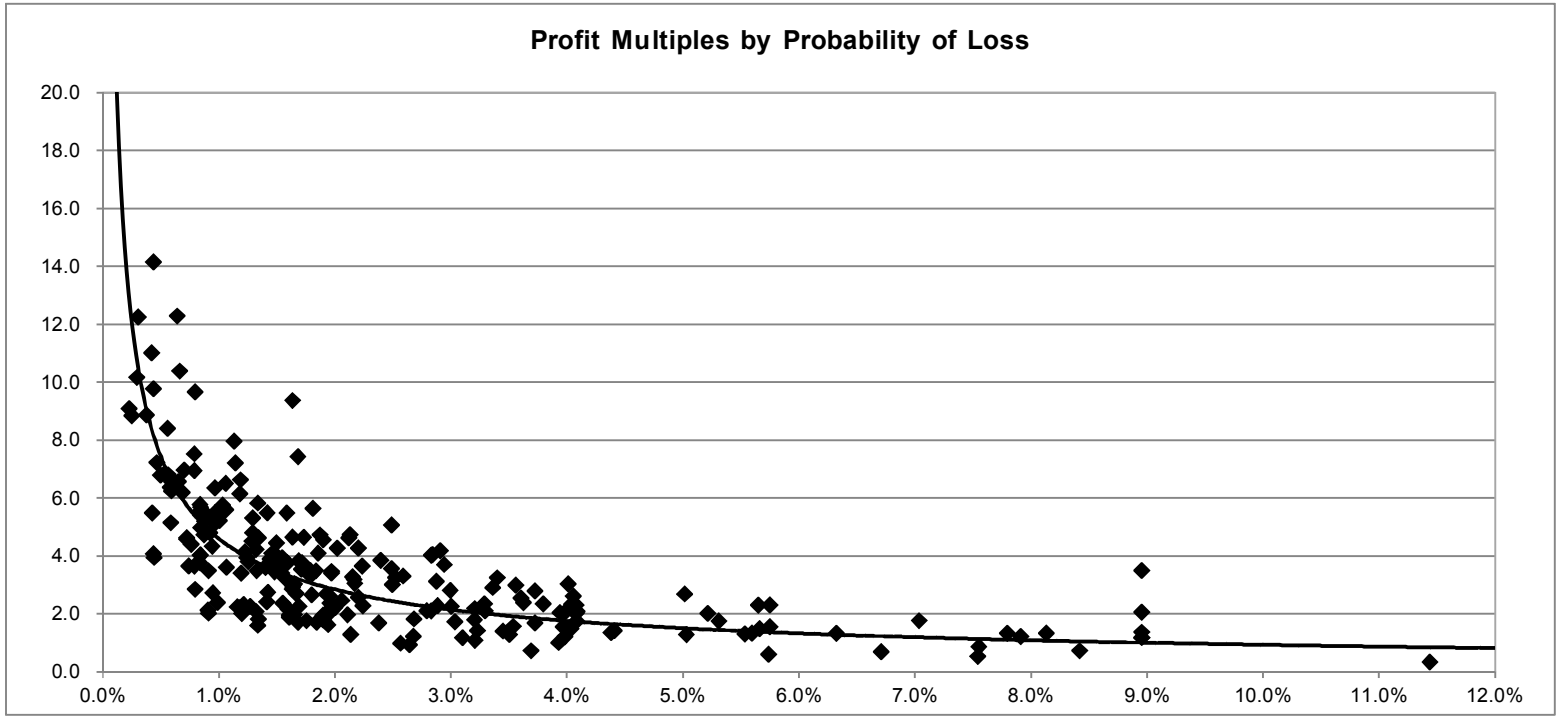
Contract [1]	Attachment Point ($ Millions)	Exhaustion Point ($ Millions)	Coverage	Reinstatement
Reinsurance Layers:				
Layer 1	2,100.0	2,478.0	100.0%	No
Layer 2	2,478.0	2,728.0	100.0%	No
Layer 3A	2,728.0	3,170.0	43.439%	No
Layer 3B	2,728.0	3,170.0	56.561%	No
Layer 4	3,170.0	3,550.0	100.0%	No

Notes: The above reinsurance covers aggregate loss for all accounts combined (Residential & Commercial).

(1) Reinsurance provides Annual Aggregate coverage.

NCIUA - North Carolina Beach Plan

Catastrophe Bond Profit Multiples



Source: Lane Financial LLC, Annual Securitization Reviews.

Notes: Based on near-term cat bonds issued from January 2006 to March 2016.

Includes all U.S. bonds with a probability of loss between 0.05% and 20.0%; excludes bonds with no stated profit multiples.

Equation of the fitted curve: $y = 0.18974\ x^{-0.69189}$

Equation to determine average Profit Multiple over specific interval: $\text{Avg PM} = \int_a^b 0.18974\ x^{-0.69189} dx\ /\ (b-a)$

NCIUA - North Carolina Beach Plan

Catastrophe Bond Profit Multiples

Annual Aggregate Layer [1]	Total Beach Plan Layer Attachment	Total Beach Plan Layer Exhaustion [2]	Attachment Probability	Exhaustion Probability	Profit Multiple

$3,550 & Higher	3,550.0	*42,943.3*	1.63%	0.0005%	9.77

(1) The first layer (up to $1,217 million) was selected to be equal to an event that would exhaust the BP-Residential allocated surplus of $1.03 billion.
Total BP surplus of $1.1 billion is based on Guy Carpenter's estimate of the NCIUA's retained earnings during a covered event.
The $1.1 billion of estimated surplus is allocated to each account based on the following amounts of members equity as of 12/31/15:
Current surplus: BP-Residential = $1.09 billion; BP-Commercial = $72.4 million
Allocated surplus: BP-Residential = $1.03 billion; BP-Commercial = $68.5 million

(2) The Layer Exhaustion for the highest layer was selected to be equal to the greatest annual amount of modeled hurricane losses.

NCRB INVESTMENT INCOME CALCULATION
DWELLING INSURANCE - FIRE
Projected Investment Earnings on Loss, Loss
Adjustment Expense and Unearned Premium Reserves

A. UNEARNED PREMIUM RESERVES		
1. Direct Earned Premiums		1,000,000
2. Mean UEPR	48.27%	482,700
3. Deductions for prepaid expenses		
Commissions & Brokerage	11.00%	
Taxes, Licenses & Fees	2.33%	
One Half Other Acquisition Expense	4.34%	
One Half General Expense	3.09%	
Total	20.77%	
4. Deduction for Prepaid Expenses: (2) x (3)		100,263
5. Net UEPR Subject to Inv (4) - (2)		382,437
B. Loss and Loss Expense Reserves		
1. Direct Earned Premium		1,000,000
2. Expected Inc L & LAE to Premium Ratio	0.6082	608,212
3. Expected Mean L&LAE Reserve to Inc. L & LAE Ratio	0.856	520,384
C. Net PH Funds Subj to Inv (A5 + B3)		902,821
D. Average Rate of Return		3.22%
E. Investment Earnings from Net Reserves (D) x (E)		29,071
F. Average Rate of Return as a Percent of Direct Earned Premium (E) / (A1)		2.91%

ESTIMATED INVESTMENT EARNINGS ON UNEARNED PREMIUM RESERVES AND ON LOSS RESERVES

EXPLANATORY NOTES

Line A-1
All calculations are displayed per $1,000,000 direct earned premiums.

Line A-2
The mean unearned premium reserve is determined by multiplying the direct earned premiums in line (1) by the ratio of the mean unearned premium reserve to the collected earned premium for calendar year ended 12/31/current year for all companies writing Dwelling insurance in North Carolina. These data are from page 15 of the Annual Statement.

1. Collected Earned Premium for Calendar Year ended 12/31/current year	224,767,028
2. Unearned Premium Reserve as of 12/31/prior year	108,296,002
3. Unearned Premium Reserve as of 12/31/current year	108,709,303
4. Mean Unearned Premium Reserve 1/2 [(2) + (3)]	108,502,653
5. Ratio (4) ÷ (1)	0.4827

Line A-3
Deduction for prepaid expenses:
Production costs and a large part of the other company expenses in connection with the writing and handling of Dwelling policies, exclusive of claim adjustment expenses, are incurred when the policy is written and before the premium is paid. The deduction for these expenses is determined from data provided by the NCRB for the year ended 12/31/current year.

ESTIMATED INVESTMENT EARNINGS ON UNEARNED PREMIUM RESERVES AND ON LOSS RESERVES

EXPLANATORY NOTES

Line B-2

The expected loss and loss adjustment expense ratio reflects the expense provisions for the year ended 12/31/current year.

Line B-3

The mean loss reserve is determined by multiplying the incurred losses in line (2) by the North Carolina ratio of the mean loss reserves to the incurred losses for Dwelling insurance. This ratio is based on North Carolina companies' Page 15 annual statement data and has been adjusted to include loss adjustment expense reserves.

1	Incurred Losses for CY	2010	107,207,282
2	Incurred Losses for CY	2011	102,073,802

ESTIMATED INVESTMENT EARNINGS ON UNEARNED
PREMIUM RESERVES AND ON LOSS RESERVES

EXPLANATORY NOTES

Line E

The average rate of return is calculated as the arithmetic mean of the embedded and current yields. The embedded yield is the sum of two ratios: the most recent ratio of investment income to invested assets, plus the ten year average ratio of capital gains to invested assets (see page 12). The current yield is the estimated, currently available rate of return (including income and expected capital gains) on the property/casualty industry investment portfolio (see page 11).

Embedded Yield =	3.13% + 0.34% =	3.47%
Current Yield =		2.98%
Average =		3.22%

PORTFOLIO YIELD AND TAX RATE - CURRENT YIELD

NCRB INVESTMENT INCOME CALCULATION
DWELLING INSURANCE - EXTENDED COVERAGE
Projected Investment Earnings on Loss, Loss
Adjustment Expense and Unearned Premium Reserves

A. UNEARNED PREMIUM RESERVES		
1. Direct Earned Premiums		1,000,000
2. Mean UEPR	48.12%	481,200
3. Deductions for prepaid expenses		
Commissions & Brokerage	9.80%	
Taxes, Licenses & Fees	2.08%	
One Half Other Acquisition Expense	2.56%	
One Half General Expense	1.51%	
Cost of Reinsurance	33.69%	
Total	49.64%	
4. Deduction for Prepaid Expenses: (2) x (3)		238,852
5. Net UEPR Subject to Inv (4) - (2)		242,348
B. Loss and Loss Expense Reserves		
1. Direct Earned Premium		1,000,000
2. Expected Inc L & LAE to Premium Ratio	0.4515	451,479
3. Expected Mean L&LAE Reserve to Inc. L & LAE Ratio	0.555	250,410
C. Net PH Funds Subj to Inv (A5 + B3)		492,758
D. Average Rate of Return		3.22%
E. Investment Earnings from Net Reserves (D) x (E)		15,867
F. Average Rate of Return as a Percent of Direct Earned Premium (E) / (A1)		1.59%

ESTIMATED INVESTMENT EARNINGS ON UNEARNED PREMIUM RESERVES AND ON LOSS RESERVES

EXPLANATORY NOTES

Line A-1

All calculations are displayed per $1,000,000 direct earned premiums.

Line A-2

The mean unearned premium reserve is determined by multiplying the direct earned premiums in line (1) by the ratio of the mean unearned premium reserve to the collected earned premium for calendar year ended 12/31/current year for all companies writing Dwelling insurance in North Carolina. These data are from page 15 of the Annual Statement.

1. Collected Earned Premium for Calendar Year ended 12/31/current year	215,645,897
2. Unearned Premium Reserve as of 12/31/prior year	97,612,198
3. Unearned Premium Reserve as of 12/31/current year	109,909,322
4. Mean Unearned Premium Reserve 1/2 [(2) + (3)]	103,760,760
5. Ratio (4) ÷ (1)	0.4812

Line A-3

Deduction for prepaid expenses:

Production costs and a large part of the other company expenses in connection with the writing and handling of Dwelling policies, exclusive of claim adjustment expenses, are incurred when the policy is written and before the premium is paid. The deduction for these expenses is determined from data provided by the NCRB for the year ended 12/31/current year.

ESTIMATED INVESTMENT EARNINGS ON UNEARNED PREMIUM RESERVES AND ON LOSS RESERVES

EXPLANATORY NOTES

Line B-2

The expected loss and loss adjustment expense ratio reflects the expense provisions for the year ended 12/31/current year.

Line B-3

The mean loss reserve is determined by multiplying the incurred losses in line (2) by the North Carolina ratio of the mean loss reserves to the incurred losses for Dwelling insurance. This ratio is based on North Carolina companies' Page 15 annual statement data and has been adjusted to include loss adjustment expense reserves.

1	Incurred Losses for CY	2010	51,589,781
2	Incurred Losses for CY	2011	270,408,965
3	Incurred Losses for CY	2012	73,137,289
4	Incurred Losses for CY	2013	54,370,019
5	Incurred Losses for CY	2014	70,749,863
6	Loss Reserves as of 12/31	2009	27,203,722
7	Loss Reserves as of 12/31	2010	25,925,811
8	Loss Reserves as of 12/31	2011	76,934,173
9	Loss Reserves as of 12/31	2012	38,555,719
10	Loss Reserves as of 12/31	2013	30,271,468
11	Loss Reserves as of 12/31	2014	32,119,812
12	Mean Loss Reserve	2010	26,564,767
13	Mean Loss Reserve	2011	51,429,992

19	Loss Reserve Ratio	2012	0.790
20	Loss Reserve Ratio	2013	0.633
21	Loss Reserve Ratio	2014	0.441
22	Average Loss Reserve Ratio		0.514
23	Ratio of LAE Reserves to Loss Reserves		0.249
24	Ratio of Incurred LAE to Incurred Losses		0.157
25	Loss and LAE Reserve/Incurred Loss&LAE		0.555

ESTIMATED INVESTMENT EARNINGS ON UNEARNED
PREMIUM RESERVES AND ON LOSS RESERVES

EXPLANATORY NOTES

Line E

The average rate of return is calculated as the arithmetic mean of the embedded and current yields. The embedded yield is the sum of two ratios: the most recent ratio of investment income to invested assets, plus the ten year average ratio of capital gains to invested assets (see page 12). The current yield is the estimated, currently available rate of return (including income and expected capital gains) on the property/casualty industry investment portfolio (see page 11).

Embedded Yield =	3.13% + 0.34% =	3.47%
Current Yield =		2.98%
Average =		3.22%

PORTFOLIO YIELD AND TAX RATE - CURRENT YIELD

(1) Investable Asset	(2) Percent of Assets	(3) Estimated Prospective Pre-Tax Return	(4) Tax Rate	(5) Estimated Prospective Post-Tax Return
